

# Package ‘aion’

February 27, 2025

**Title** Archaeological Time Series

**Version** 1.4.0

**Description** A toolkit for archaeological time series and time intervals.

This package provides a system of classes and methods to represent and work with archaeological time series and time intervals. Dates are represented as “`rata die” and can be converted to (virtually) any calendar defined by Reingold and Dershowitz (2018) [doi:10.1017/9781107415058](https://doi.org/10.1017/9781107415058). This packages offers a simple API that can be used by other specialized packages.

**License** GPL (>= 3)

**URL** <https://codeberg.org/tesselle/aion>,  
<https://packages.tesselle.org/aion/>

**BugReports** <https://codeberg.org/tesselle/aion/issues>

**Depends** R (>= 3.3)

**Imports** arkhe (>= 1.10.0), graphics, grDevices, methods, stats, utils

**Suggests** folio (>= 1.5.0), igrph, knitr, markdown, rsvg, svglite,  
tinysnapshot, tinytest

**VignetteBuilder** knitr

**Encoding** UTF-8

**LazyData** true

**RoxygenNote** 7.3.2

**X-schema.org-applicationCategory** Archaeological Science

**X-schema.org-isPartOf** <https://www.tesselle.org>

**X-schema.org-keywords** time-series, r-package, archaeology,  
archaeological-science, chronology, r-package

### Description

Operators performing arithmetic operations.

### Usage

```
## S4 method for signature 'RataDie,RataDie'
Arith(e1, e2)
```

```
## S4 method for signature 'numeric,RataDie'
Arith(e1, e2)
```

```
## S4 method for signature 'RataDie,numeric'
Arith(e1, e2)
```

### Arguments

e1, e2            A [RataDie](#) object or a [numeric](#) vector.

### Details

*Rata die* will be converted to a plain numeric vector if a computation no longer makes sense in temporal terms.

### Value

A [logical](#) vector.

### Author(s)

N. Frerebeau

### See Also

Other fixed date tools: [as\\_date\(\)](#), [as\\_decimal\(\)](#), [as\\_fixed\(\)](#), [as\\_year\(\)](#), [fixed\(\)](#), [fixed\\_gregorian](#), [fixed\\_julian](#), [format\(\)](#), [pretty\(\)](#)

**Examples**

```
## Vectors of years
x <- fixed(c(-350, 31, 1072, 576, 1130), calendar = CE())
y <- fixed(c(1494, 1645, -869, 1440, 1851), calendar = CE())

## Move forward in time
x + y

## Move backward in time
x - y

## Not rata die anymore
x * y
```

---

as.data.frame

*Coerce to a Data Frame*

---

**Description**

Coerce to a Data Frame

**Usage**

```
## S4 method for signature 'TimeSeries'
as.data.frame(x, ..., calendar = NULL)

## S4 method for signature 'TimeIntervals'
as.data.frame(x, ..., calendar = NULL)
```

**Arguments**

|          |   |
|----------|---|
| x        | A <a href="#">TimeSeries</a> or a <a href="#">TimeIntervals</a> object.   |
| ...      | Further parameters to be passed to <a href="#">data.frame()</a> .   |
| calendar | A <a href="#">TimeScale</a> object specifying the target calendar (see <a href="#">calendar()</a> ). If NULL (the default), <i>rata die</i> are returned. |

**Value**

A [data.frame](#).

**Methods (by class)**

- `as.data.frame(TimeSeries)`: Returns a long [data.frame](#) with the following columns:
  - `time` The (decimal) years at which the time series was sampled.
  - `series` The name of the time series.
  - `variable` The name of the variables.
  - `value` The observed value.

- `as.data.frame(TimeIntervals)`: Returns a [data.frame](#) with the following columns:
  - label The name of the intervals.
  - start The start time of the intervals, in (decimal) years.
  - end The end time of the intervals, in (decimal) years.

**Author(s)**

N. Frerebeau

**See Also**

Other mutators: [labels\(\)](#), [length\(\)](#), [subset\(\)](#)

**Examples**

```
## Create time-series of 20 observations

## Univariate
## Sampled every years starting from 1029 BCE
(X <- series(rnorm(30), time = 1029:1000, calendar = BCE()))

## Terminal and sampling times (returns rata die)
start(X)
end(X)
time(X)
span(X)

## Multivariate
## Sampled every century starting from 1000 CE
(Y <- series(matrix(rnorm(90), 30, 3), time = 1000:1029, calendar = CE()))

## Terminal and sampling times (returns Gregorian Common Era years)
start(Y, calendar = CE())
end(Y, calendar = CE())
time(Y, calendar = CE())
span(Y, calendar = CE())

## Coerce to data frame
df <- as.data.frame(Y, calendar = BP())
head(df)
```

---

as\_date

*Date Conversion from Rata Die*

---

**Description**

Date Conversion from *Rata Die*

**Usage**

```
as_date(object, calendar)

## S4 method for signature 'numeric,GregorianCalendar'
as_date(object, calendar)

## S4 method for signature 'numeric,JulianCalendar'
as_date(object, calendar)
```

**Arguments**

object            A [RataDie](#) object (see [fixed\(\)](#)).

calendar         A [TimeScale](#) object specifying the target calendar (see [calendar\(\)](#)).

**Value**

A [numeric](#) vector of (decimal) years.

**Author(s)**

N. Frerebeau

**References**

Reingold, E. M. and Dershowitz, N. (2018). *Calendrical Calculations: The Ultimate Edition*. Cambridge University Press. doi:[10.1017/9781107415058](https://doi.org/10.1017/9781107415058).

Other fixed date tools: [arithmetic](#), [as\\_decimal\(\)](#), [as\\_fixed\(\)](#), [as\\_year\(\)](#), [fixed\(\)](#), [fixed\\_gregorian](#), [fixed\\_julian](#), [format\(\)](#), [pretty\(\)](#)

**Examples**

```
## R 1.0.0
(y <- fixed(year = 2000, month = 02, day = 29, calendar = CE()))
as_date(y, calendar = CE())
as_year(y, calendar = CE())

## Create a vector of years BP (Gregorian)
## (every two years starting from 2000 BP)
(years <- seq(from = 2000, by = -2, length.out = 10))
## Convert years to rata die
(rd <- fixed(years, calendar = BP()))
## Convert back to Gregorian years BP
as_year(rd, calendar = BP())

## More convenient
(rd <- fixed_from_BP(years))
fixed_to_BP(rd)
```

---

`as_decimal`*Converts a Date to a Decimal of its Year*

---

## Description

Converts a Date to a Decimal of its Year

## Usage

```
as_decimal(year, month, day, calendar)
```

```
## S4 method for signature 'numeric,numeric,numeric,GregorianCalendar'  
as_decimal(year, month, day, calendar)
```

```
## S4 method for signature 'numeric,numeric,numeric,JulianCalendar'  
as_decimal(year, month, day, calendar)
```

## Arguments

|                       |  |
|-----------------------|--|
| <code>year</code>     | A <a href="#">numeric</a> vector of years. If month and day are missing, decimal years are expected.                 |
| <code>month</code>    | A <a href="#">numeric</a> vector of months.  |
| <code>day</code>      | A <a href="#">numeric</a> vector of days.  |
| <code>calendar</code> | A <a href="#">TimeScale</a> object specifying the calendar of year, month and day (see <a href="#">calendar()</a> ). |

## Value

A [numeric](#) vector of (ecimal years).

## Author(s)

N. Frerebeau

## See Also

## Convert back to Gregorian years BP
as_year(rd, calendar = BP())

## More convenient
(rd <- fixed_from_BP(years))
fixed_to_BP(rd)
```

as\_graph

*Interval Graph***Description**

Interval Graph

**Usage**

```
as_graph(object, ...)

## S4 method for signature 'TimeIntervals'
as_graph(object, aggregate = TRUE, ...)
```

**Arguments**

|           |  |
|-----------|--|
| object    | A <a href="#">TimeIntervals</a> object.  |
| ...       | Currently not used.  |
| aggregate | A <a href="#">logical</a> scalar: should disjoint intervals referring to the same event be aggregated? |

**Details**

An interval graph is the graph showing intersecting intervals on a line. As time is linear and not circular, an interval graph contains no cycles with more than three edges and no shortcuts.

**Value**

An **igraph** graph object.

**Author(s)**

N. Frerebeau

**See Also**Other chronological reasoning tools: [overlap\(\)](#)**Examples**

```
## Not run:
## Seven intervals
int <- intervals(
  start = c(1, 2, 3, 6, 9, 13, 17),
  end = c(7, 4, 15, 14, 11, 18, 19),
  calendar = CE(),
  names = c("A", "B", "C", "D", "E", "F", "G")
)

## Do the intervals overlap?
overlap(int) > 0

## Interval graph
g <- as_graph(int)
plot(g)

## End(Not run)
```

---

as\_year

*Year Conversion from Rata Die*

---

**Description**Year Conversion from *Rata Die***Usage**

```
as_year(object, calendar, ...)

## S4 method for signature 'numeric,GregorianCalendar'
as_year(object, calendar, decimal = TRUE, ...)

## S4 method for signature 'numeric,JulianCalendar'
as_year(object, calendar, decimal = FALSE, ...)
```

**Arguments**

|          |  |
|----------|--|
| object   | A <a href="#">RataDie</a> object (see <a href="#">fixed()</a> ).   |
| calendar | A <a href="#">TimeScale</a> object specifying the target calendar (see <a href="#">calendar()</a> ).       |
| ...      | Currently not used.  |
| decimal  | A <a href="#">logical</a> scalar: should decimal years be returned? If FALSE, the decimal part is dropped. |

**Value**

A [numeric](#) vector of (decimal) years.

**Author(s)**

N. Frerebeau

**References**

Reingold, E. M. and Dershowitz, N. (2018). *Calendrical Calculations: The Ultimate Edition*. Cambridge University Press. [doi:10.1017/9781107415058](https://doi.org/10.1017/9781107415058).

**See Also**

Other fixed date tools: [arithmetic](#), [as\\_date\(\)](#), [as\\_decimal\(\)](#), [as\\_fixed\(\)](#), [fixed\(\)](#), [fixed\\_gregorian](#), [fixed\\_julian](#), [format\(\)](#), [pretty\(\)](#)

**Examples**

```
## R 1.0.0
(y <- fixed(year = 2000, month = 02, day = 29, calendar = CE()))
as_date(y, calendar = CE())
as_year(y, calendar = CE())

## Create a vector of years BP (Gregorian)
## (every two years starting from 2000 BP)
(years <- seq(from = 2000, by = -2, length.out = 10))
## Convert years to rata die
(rd <- fixed(years, calendar = BP()))
## Convert back to Gregorian years BP
as_year(rd, calendar = BP())

## More convenient

```

---

|          |                 |
|----------|-----------------|
| calendar | <i>Calendar</i> |
|----------|-----------------|

---

**Description**

Calendar

**Usage**

```
calendar(object)
```

```
## S4 method for signature 'character'
calendar(object)
```

**Arguments**

object            A [character](#) string specifying the abbreviated label of the time scale (see details).

**Details**

The following time scales are available:

| <b>label</b> | <b>era</b>        | <b>calendar</b> |
|--------------|-------------------|-----------------|
| BP           | Before Present    | Gregorian       |
| BC           | Before Christ     | Gregorian       |
| BCE          | Before Common Era | Gregorian       |
| AD           | Anno Domini       | Gregorian       |
| CE           | Common Era        | Gregorian       |
| b2k          | Years before 2000 | Gregorian       |
| julian       |                   | Julian          |

**Value**

A [TimeScale](#) object.

**Note**

Inspired by [era::era\(\)](#) by Joe Roe.

**Author(s)**

N. Frerebeau

**See Also**

Other calendar tools: [calendar\\_get](#), [convert\(\)](#), [get\\_calendar\(\)](#), [gregorian](#), [is\\_calendar\(\)](#), [julian\(\)](#)

**Examples**

```
## Define time scales
calendar("BP")
calendar("AD")
calendar("julian")

## Shortcuts
BP()
AD()
J()
```

|--------------|----------------------------|
| calendar_get | <i>Calendar Parameters</i> |
|--------------|----------------------------|

---

**Description**

Calendar Parameters

**Usage**

```
calendar_label(object)

calendar_name(object)

calendar_unit(object)

calendar_epoch(object)

calendar_fixed(object)

calendar_direction(object)

calendar_year(object)

## S4 method for signature 'TimeScale'
calendar_label(object)

## S4 method for signature 'TimeScale'
calendar_name(object)

## S4 method for signature 'TimeScale'
calendar_unit(object)

## S4 method for signature 'TimeScale'
calendar_epoch(object)

## S4 method for signature 'TimeScale'
```

```
calendar_fixed(object)

## S4 method for signature 'TimeScale'
calendar_direction(object)

## S4 method for signature 'NULL'
calendar_direction(object)

## S4 method for signature 'TimeScale'
calendar_year(object)
```

### Arguments

object            A [TimeScale](#) object.

### Value

- `calendar_label()` returns a [character](#) string giving the abbreviated label of the time scale.
- `calendar_name()` returns a [character](#) string giving the name of the time scale.
- `calendar_unit()` returns a [character](#) string giving the unit of the calendar.
- `calendar_fixed()` returns a length-one [numeric](#) vector giving the reference date of the calendar (in *rata die*).
- `calendar_epoch()` returns a length-one [numeric](#) vector giving the epoch year from which years are counted (starting date of the calendar, in years).
- `calendar_direction()` returns a length-one [integer](#) vector specifying if years are counted backwards (-1) or forwards (1) from epoch. Only the [sign](#) of `calendar_direction()` is relevant.
- `calendar_year()` returns a length-one [numeric](#) vector giving the average length of the year in solar days.

### Author(s)

N. Frerebeau

### See Also

Other calendar tools: [calendar\(\)](#), [convert\(\)](#), [get\\_calendar\(\)](#), [gregorian](#), [is\\_calendar\(\)](#), [julian\(\)](#)

### Examples

```
## Define time scales
calendar("BP")
calendar("AD")
calendar("julian")

## Shortcuts
BP()
```

```
AD()
J()
```

---

|         |                           |
|---------|---------------------------|
| convert | <i>Calendar Converter</i> |
|---------|---------------------------|

---

## Description

Interconverts dates in a variety of calendars.

## Usage

```
convert(from, to, ...)
```

```
## S4 method for signature 'character,character'
```

```
convert(from, to)
```

```
## S4 method for signature 'TimeScale,TimeScale'
```

```
convert(from, to)
```

## Arguments

|      |  |
|------|--|
| from | A <a href="#">TimeScale</a> object describing the source calendar. |
| to   | A <a href="#">TimeScale</a> object describing the target calendar. |
| ...  | Currently not used.  |

## Value

A [function](#) that when called with a single numeric argument (fractional years) converts years from one calendar to another.

## Author(s)

N. Frerebeau

## See Also

Other calendar tools: [calendar\(\)](#), [calendar\\_get](#), [get\\_calendar\(\)](#), [gregorian](#), [is\\_calendar\(\)](#), [julian\(\)](#)

## Examples

```
## Define time scales
BP <- calendar("BP")
AD <- calendar("AD")

## Make conversion functions
BP_to_AD <- convert(BP, AD)
```

```
AD_to_BP <- convert(AD, BP)

## Convert years
BP_to_AD(0)
AD_to_BP(1950)
```

---

dates

*Sample Data from Reingold and Dershowitz (2018)*

---

### Description

A dataset of 33 dates from the years -1000 to 2100 with their equivalents on different calendars.

### Usage

dates

### Format

A `data.frame` with 33 rows and 14 variables:

rata\_die Rata die.

weekday Week day.

jd Julian day.

mjd Modified Julian day.

unix Unix.

gregorian\_year, gregorian\_month, gregorian\_day Gregorian date.

julian\_year, julian\_month, julian\_day Julian date.

egyptian\_year, egyptian\_month, egyptian\_day Egyptian date.

fixed(year, month, day, calendar, ...)  
  
## S4 method for signature 'numeric,missing,missing,GregorianCalendar'  
fixed(year, calendar, scale = 1)  
  
## S4 method for signature 'numeric,numeric,numeric,GregorianCalendar'  
fixed(year, month, day, calendar)  
  
## S4 method for signature 'numeric,missing,missing,JulianCalendar'  
fixed(year, calendar, scale = 1)  
  
## S4 method for signature 'numeric,numeric,numeric,JulianCalendar'  
fixed(year, month, day, calendar)
```

## Arguments

|          |  |
|----------|--|
| year     | A <a href="#">numeric</a> vector of years. If month and day are missing, decimal years are expected.   |
| month    | A <a href="#">numeric</a> vector of months.  |
| day      | A <a href="#">numeric</a> vector of days.  |
| calendar | A <a href="#">TimeScale</a> object specifying the calendar of year, month and day (see <a href="#">calendar()</a> ).                                 |
| ...      | Currently not used.  |
| scale    | A length-one <a href="#">integer</a> vector specifying the number of years represented by one unit. It should be a power of 10 (i.e. 1000 means ka). |

## Details

*Rata die* are represented as the number of days since 01-01-01 (Gregorian), with negative values for earlier dates.

## Value

A [RataDie](#) object.

## Author(s)

N. Frerebeau

**References**

fixed\_gregorian

Rata Die *Conversion to and from Gregorian Years*

---

**Description**

Convenient functions for conversion from and to *rata die* for a given Gregorian era.

**Usage**

```
fixed_from_BP(year, month, day)

fixed_to_BP(object)

fixed_from_BC(year, month, day)

fixed_to_BC(object)

fixed_from_BCE(year, month, day)

fixed_to_BCE(object)
```

```
fixed_from_AD(year, month, day)
```

```
fixed_to_AD(object)
```

```
fixed_from_CE(year, month, day)
```

```
fixed_to_CE(object)
```

```
fixed_from_b2k(year, month, day)
```

```
fixed_to_b2k(object)
```

### Arguments

|        |   |
|--------|---|
| year   | A <b>numeric</b> vector of years. If month and day are missing, decimal years are expected. |
| month  | A <b>numeric</b> vector of months.  |
| day    | A <b>numeric</b> vector of days.  |
| object | A <b>RataDie</b> object (see <code>fixed()</code> ).  |

### Details

The astronomical notation is used for Gregorian years (there *is* a year 0).

### Value

- `fixed_from_*`() returns a **RataDie** object.
- `fixed_to_*`() returns a **numeric** vector of Gregorian years.

### Author(s)

N. Frerebeau

### References

Reingold, E. M. and Dershowitz, N. (2018). *Calendrical Calculations: The Ultimate Edition*. Cambridge University Press. doi:10.1017/9781107415058.

| fixed_julian | Rata Die <i>Conversion to and from Julian Years</i> |
|--------------|---|

---

## Description

Convenient functions for conversion from and to *rata die*.

## Usage

```
fixed_from_julian(year, month, day)
```

```
fixed_to_julian(object)
```

## Arguments

|        |   |
|--------|---|
| year   | A <b>numeric</b> vector of years. If month and day are missing, decimal years are expected. |
| month  | A <b>numeric</b> vector of months.  |
| day    | A <b>numeric</b> vector of days.  |
| object | A <b>RataDie</b> object (see <code>fixed()</code> ).  |

## Value

- `fixed_from_julian()` returns a **RataDie** object.
- `fixed_to_julian()` returns a **numeric** vector of Julian years.

## Author(s)

N. Frerebeau

*Date Conversion to Character***Description**

Date Conversion to Character

**Usage**

```
## S4 method for signature 'TimeScale'
format(x, ...)

## S4 method for signature 'RataDie'
format(
  x,
  prefix = c("a", "ka", "Ma", "Ga"),
  label = TRUE,
  calendar = get_calendar(),
  ...
)
```

**Arguments**

x                   A [RataDie](#) object.  
...                   Currently not used.

|          |   |
|----------|---|
| prefix   | A <a href="#">character</a> string specifying the prefix. It should be one of "a", "ka", "Ma" or "Ga". If TRUE, a good guess for an appropriate format is made. |
| label    | A <a href="#">logical</a> scalar: should the label of the calendar be displayed?  |
| calendar | A <a href="#">TimeScale</a> object specifying the target calendar (see <a href="#">calendar()</a> ).  |

**Value**

A [character](#) vector representing the date.

**Author(s)**

N. Frerebeau

intervals *Create Time Intervals*

---

**Description**

An Interval is elapsed time in seconds between two specific years.

**Usage**

```
intervals(start, end, calendar, ...)

## S4 method for signature 'RataDie,RataDie,missing'
intervals(start, end, names = NULL)

## S4 method for signature 'numeric,numeric,TimeScale'
intervals(start, end, calendar, scale = 1, names = NULL)
```

**Arguments**

|          |  |
|----------|--|
| start    | A <a href="#">numeric</a> vector of (decimal) years or a <a href="#">RataDie</a> object (see <a href="#">fixed()</a> ) giving the beginning of the time intervals. |
| end      | A <a href="#">numeric</a> vector of (decimal) years or a <a href="#">RataDie</a> object (see <a href="#">fixed()</a> ) giving the end of the time intervals.       |
| calendar | A <a href="#">TimeScale</a> object specifying the calendar of time (see <a href="#">calendar()</a> ). If missing, time must be a <a href="#">RataDie</a> object.   |
| ...      | Currently not used.  |
| names    | A <a href="#">character</a> string specifying the names of the time series.  |
| scale    | A length-one <a href="#">numeric</a> vector specifying the number of years represented by one unit. It should be a power of 10 (i.e. 1000 means ka).               |

**Value**

A [TimeIntervals](#) object.

**Author(s)**

N. Frerebeau

**Examples**

```
## Create time intervals
int <- intervals(
  start = c(625, 700, 1200, 1225, 1250, 500, 1000, 1200,
            1325, 1375, 1200, 1300, 1375, 1275, 1325),
  end = c(750, 825, 1250, 1275, 1325, 700, 1300, 1325,
          1400, 1500, 1300, 1375, 1500, 1325, 1425),
  calendar = CE())
```

```
)  
  
## Plot intervals  
plot(int) # Default calendar  
  
## Overlap  
overlap(int, calendar = CE())
```

---

is\_calendar

*Is an Object a Calendar?*

---

### Description

Test inheritance relationships between an object and a calendar class.

### Usage

```
is_calendar(object)  
  
is_gregorian(object)  
  
is_julian(object)
```

### Arguments

object            Any R object.

### Value

A [logical](#) scalar.

---

 overlap

*Time Overlap*

---

**Description**

Computes the length of overlap of time intervals.

**Usage**

```
overlap(x, ...)
```

```
## S4 method for signature 'TimeIntervals'
overlap(x, calendar = NULL, aggregate = TRUE)
```

**Arguments**

|           |   |
|-----------|---|
| x         | A <a href="#">TimeIntervals</a> object.   |
| ...       | Currently not used.   |
| calendar  | A <a href="#">TimeScale</a> object specifying the target calendar (see <a href="#">calendar()</a> ). If NULL (the default), <i>rata die</i> are returned. |
| aggregate | A <a href="#">logical</a> scalar: should disjoint intervals referring to the same event be aggregated?  |

**Details**

The overlap of two time intervals is a difference between the minimum value of the two upper boundaries and the maximum value of the two lower boundaries, plus 1.

**Value**

A symmetric numeric [matrix](#) of years.

**Author(s)**

N. Frerebeau

**See Also**

Other chronological reasoning tools: [as\\_graph\(\)](#)

**Examples**

```
## Create time intervals
int <- intervals(
  start = c(625, 700, 1200, 1225, 1250, 500, 1000, 1200,
            1325, 1375, 1200, 1300, 1375, 1275, 1325),
  end   = c(750, 825, 1250, 1275, 1325, 700, 1300, 1325,
            1400, 1500, 1300, 1375, 1500, 1325, 1425),
  calendar = CE()
)

## Plot intervals
plot(int) # Default calendar

## Overlap
overlap(int, calendar = CE())
```

---

*Plot Time Series and Time Intervals*

---

**Description**

Plot Time Series and Time Intervals

**Usage**

```
## S4 method for signature 'TimeIntervals,missing'
plot(
  x,
  calendar = get_calendar(),
  sort = TRUE,
  decreasing = FALSE,
  xlab = NULL,
  ylab = NULL,
  main = NULL,
  sub = NULL,
  ann = graphics::par("ann"),
  axes = TRUE,
  frame.plot = axes,
  panel.first = NULL,
  panel.last = NULL,
  ...
)

## S4 method for signature 'TimeSeries,missing'
```

```

plot(
  x,
  facet = c("multiple", "single"),
  calendar = get_calendar(),
  panel = graphics::lines,
  flip = FALSE,
  ncol = NULL,
  xlab = NULL,
  ylab = NULL,
  main = NULL,
  sub = NULL,
  ann = graphics::par("ann"),
  axes = TRUE,
  frame.plot = axes,
  panel.first = NULL,
  panel.last = NULL,
  ...
)

```

### Arguments

|             |  |
|-------------|--|
| x           | A <a href="#">TimeSeries</a> or a <a href="#">TimeIntervals</a> object.  |
| calendar    | A <a href="#">TimeScale</a> object specifying the target calendar (see <a href="#">calendar()</a> ).   |
| sort        | A <a href="#">logical</a> scalar: should the data be sorted in chronological order?  |
| decreasing  | A <a href="#">logical</a> scalar: should the sort order be decreasing? Only used if sort is TRUE.  |
| xlab, ylab  | A <a href="#">character</a> vector giving the x and y axis labels.   |
| main        | A <a href="#">character</a> string giving a main title for the plot.   |
| sub         | A <a href="#">character</a> string giving a subtitle for the plot.   |
| ann         | A <a href="#">logical</a> scalar: should the default annotation (title and x and y axis labels) appear on the plot?  |
| axes        | A <a href="#">logical</a> scalar: should axes be drawn on the plot?  |
| frame.plot  | A <a href="#">logical</a> scalar: should a box be drawn around the plot?   |
| panel.first | An expression to be evaluated after the plot axes are set up but before any plotting takes place. This can be useful for drawing background grids.   |
| panel.last  | An expression to be evaluated after plotting has taken place but before the axes, title and box are added.   |
| ...         | Further parameters to be passed to panel (e.g. <a href="#">graphical parameters</a> ).   |
| facet       | A <a href="#">character</a> string specifying whether the series should be plotted separately (with a common time axis) or on a single plot? It must be one of "multiple" or "single". Any unambiguous substring can be given. |
| panel       | A <a href="#">function</a> in the form <code>function(x, y, ...)</code> which gives the action to be carried out in each panel of the display. The default is <a href="#">graphics::lines()</a> .                              |
| flip        | A <a href="#">logical</a> scalar: should the y-axis (ticks and numbering) be flipped from side 2 (left) to 4 (right) from series to series when facet is "multiple"?   |

`ncol` An [integer](#) specifying the number of columns to use when facet is "multiple". Defaults to 1 for up to 4 series, otherwise to 2.

### Value

`plot()` is called for its side-effects: it results in a graphic being displayed. Invisibly returns `x`.

### Author(s)

N. Frerebeau

### See Also

|        |                           |
|--------|---------------------------|
| pretty | <i>Pretty Breakpoints</i> |
|--------|---------------------------|

---

### Description

Pretty Breakpoints

### Usage

```
## S4 method for signature 'RataDie'
pretty(x, calendar = get_calendar(), ...)
```

### Arguments

|          |  |
|----------|--|
| x        | A <a href="#">RataDie</a> object.  |
| calendar | A <a href="#">TimeScale</a> object specifying the target calendar (see <a href="#">calendar()</a> ). |
| ...      | Further parameters to be passed to <a href="#">base::pretty()</a> .                                  |

### Details

`pretty()` computes a vector of increasing numbers which are "pretty" in decimal notation of calendar. Pretty breakpoints are then converted to *rata die*.

### Value

A [RataDie](#) object.

### See Also

|---------------|----------------|
| RataDie-class | <i>RataDie</i> |
|---------------|----------------|

---

### Description

An S4 class to represent a vector of *rata die*.

### Details

*Rata die* (fixed date) are represented as the number of days since 01-01-01 (Gregorian), with negative values for earlier dates.

It is intended that the date should be an integer value, but this is not enforced in the internal representation.

**Slots**

.Data A [numeric](#) vector giving the *rata die* values.

**Note**

This class inherits from [numeric](#).

**Author(s)**

N. Frerebeau

**See Also**

Other classes: [GregorianCalendar-class](#), [JulianCalendar-class](#), [TimeIntervals-class](#), [TimeScale-class](#), [TimeSeries-class](#)

|--------|---------------------------|
| series | <i>Create Time Series</i> |
|--------|---------------------------|

---

**Description**

Create Time Series

**Usage**

```
series(object, time, calendar, ...)

## S4 method for signature 'array,RataDie,missing'
series(object, time, names = NULL)

## S4 method for signature 'array,numeric,TimeScale'
series(object, time, calendar, scale = 1, names = NULL)

## S4 method for signature 'matrix,numeric,TimeScale'
series(object, time, calendar, scale = 1, names = NULL)

## S4 method for signature 'matrix,RataDie,missing'
series(object, time, names = NULL)

## S4 method for signature 'numeric,numeric,TimeScale'
series(object, time, calendar, scale = 1, names = NULL)

## S4 method for signature 'numeric,RataDie,missing'
series(object, time, names = NULL)

## S4 method for signature 'data.frame,numeric,TimeScale'
```

```
series(object, time, calendar, scale = 1, names = NULL)

## S4 method for signature 'data.frame,RataDie,missing'
series(object, time, names = NULL)
```

### Arguments

|          |  |
|----------|--|
| object   | A <a href="#">numeric</a> vector, matrix or array of the observed time-series values. A <a href="#">data.frame</a> will be coerced to a numeric matrix via <a href="#">data.matrix()</a> . |
| time     | A <a href="#">numeric</a> vector of (decimal) years or a <a href="#">RataDie</a> object (see <a href="#">fixed()</a> ).  |
| calendar | A <a href="#">TimeScale</a> object specifying the calendar of time (see <a href="#">calendar()</a> ). If missing, time must be a <a href="#">RataDie</a> object.                           |
| ...      | Currently not used.  |
| names    | A <a href="#">character</a> string specifying the names of the time series.  |
| scale    | A length-one <a href="#">numeric</a> vector specifying the number of years represented by one unit. It should be a power of 10 (i.e. 1000 means ka).                                       |

### Details

Data will be sorted in chronological order.

### Value

A [TimeSeries](#) object.

### Author(s)

N. Frerebeau

### Examples

```
## Create time-series of 20 observations

## Univariate
## Sampled every years starting from 1029 BCE
(X <- series(rnorm(30), time = 1029:1000, calendar = BCE()))

## Terminal and sampling times (returns rata die)
start(X)
end(X)
time(X)
span(X)

## Multivariate
## Sampled every century starting from 1000 CE
(Y <- series(matrix(rnorm(90), 30, 3), time = 1000:1029, calendar = CE()))

## Terminal and sampling times (returns Gregorian Common Era years)
start(Y, calendar = CE())
end(Y, calendar = CE())
```

```
time(Y, calendar = CE())
span(Y, calendar = CE())

## Coerce to data frame
df <- as.data.frame(Y, calendar = BP())
head(df)
```

---

|      |                 |
|------|-----------------|
| span | <i>Duration</i> |
|------|-----------------|

---

### Description

Get the duration of time series or intervals.

### Usage

```
span(x, ...)
```

```
## S4 method for signature 'TimeSeries'
span(x, calendar = NULL)
```

```
## S4 method for signature 'TimeIntervals'
span(x, calendar = NULL)
```

### Arguments

|          |   |
|----------|---|
| x        | A <a href="#">TimeSeries</a> or a <a href="#">TimeIntervals</a> object.   |
| ...      | Currently not used.   |
| calendar | A <a href="#">TimeScale</a> object specifying the target calendar (see <a href="#">calendar()</a> ). If NULL (the default), <i>rata die</i> are returned. |

### Value

A [numeric](#) vector of years.

### Author(s)

N. Frerebeau

### See Also

Other tools: [start\(\)](#), [time\(\)](#), [window\(\)](#)

**Examples**

```
## Create time intervals
int <- intervals(
  start = c(625, 700, 1200, 1225, 1250, 500, 1000, 1200,
            1325, 1375, 1200, 1300, 1375, 1275, 1325),
  end = c(750, 825, 1250, 1275, 1325, 700, 1300, 1325,
          1400, 1500, 1300, 1375, 1500, 1325, 1425),
  calendar = CE()
)

## Get time durations
span(int, calendar = CE())
```

---

|       |                       |
|-------|-----------------------|
| start | <i>Terminal Times</i> |
|-------|-----------------------|

---

**Description**

Get the times the first and last observations were taken.

**Usage**

```
## S4 method for signature 'TimeSeries'
start(x, calendar = NULL, ...)

## S4 method for signature 'TimeIntervals'
start(x, calendar = NULL, ...)

## S4 method for signature 'TimeSeries'
end(x, calendar = NULL, ...)

## S4 method for signature 'TimeIntervals'
end(x, calendar = NULL, ...)
```

**Arguments**

|          |   |
|----------|---|
| x        | A <a href="#">TimeSeries</a> object.  |
| calendar | A <a href="#">TimeScale</a> object specifying the target calendar (see <a href="#">calendar()</a> ). If NULL (the default), <i>rata die</i> are returned. |
| ...      | Currently not used.   |

**Value**

A [numeric](#) vector of decimal years (if calendar is not NULL).

**Author(s)**

N. Frerebeau

**See Also**

Other tools: [span\(\)](#), [time\(\)](#), [window\(\)](#)

**Examples**

```
## Create time-series of 20 observations

## Univariate
## Sampled every years starting from 1029 BCE
(X <- series(rnorm(30), time = 1029:1000, calendar = BCE()))

## Terminal and sampling times (returns rata die)
start(X)
end(X)
time(X)
span(X)

```

---

subset

---

*Extract or Replace Parts of an Object*

---

**Description**

Operators acting on objects to extract or replace parts.

**Usage**

```
## S4 method for signature 'RataDie'
x[i]

## S4 method for signature 'TimeIntervals'
x[i]

## S4 method for signature 'TimeSeries'
x[i, j, k, drop = FALSE]
```

**Arguments**

|         |  |
|---------|--|
| x       | An object from which to extract element(s) or in which to replace element(s).  |
| i, j, k | Indices specifying elements to extract or replace.   |
| drop    | A <a href="#">logical</a> scalar: should the result be coerced to the lowest possible dimension? This only works for extracting elements, not for the replacement. |

**Value**

A subsetted object.

**Author(s)**

N. Frerebeau

**See Also**

Other mutators: [as.data.frame\(\)](#), [labels\(\)](#), [length\(\)](#)

---

time

*Sampling Times*

---

**Description**

Get the sampling times:

- `time()` creates the vector of times at which a time series was sampled.
- `frequency()` returns the mean number of samples per unit time.

**Usage**

```
## S4 method for signature 'TimeSeries'
time(x, calendar = NULL, ...)
```

```
## S4 method for signature 'TimeSeries'
frequency(x, ...)
```

**Arguments**

|          |   |
|----------|---|
| x        | A <a href="#">TimeSeries</a> object.  |
| calendar | A <a href="#">TimeScale</a> object specifying the target calendar (see <a href="#">calendar()</a> ). If NULL (the default), <i>rata die</i> are returned. |
| ...      | Currently not used.   |

**Value**

A [numeric](#) vector of decimal years (if calendar is not NULL).

**Author(s)**

N. Frerebeau

**See Also**

Other tools: [span\(\)](#), [start\(\)](#), [window\(\)](#)

**Examples**

```
## Create time-series of 20 observations

## Univariate
## Sampled every years starting from 1029 BCE
(X <- series(rnorm(30), time = 1029:1000, calendar = BCE()))

## Terminal and sampling times (returns rata die)
start(X)
end(X)
time(X)
span(X)

## Multivariate
## Sampled every century starting from 1000 CE
(Y <- series(matrix(rnorm(90), 30, 3), time = 1000:1029, calendar = CE()))

## Terminal and sampling times (returns Gregorian Common Era years)
start(Y, calendar = CE())
end(Y, calendar = CE())
time(Y, calendar = CE())
span(Y, calendar = CE())

## Coerce to data frame
df <- as.data.frame(Y, calendar = BP())
head(df)
```

---

TimeIntervals-class    *TimeIntervals*

---

**Description**

An S4 class to represent time intervals.

**Slots**

- .Id A [character](#) vector specifying the identifier/name of intervals. Duplicated values are interpreted as disjoint intervals referring to the same event.
- .Start A [RataDie](#) object giving the start time of the intervals.
- .End A [RataDie](#) object giving the end time of the intervals.

**Author(s)**

N. Frerebeau

**See Also**

Other classes: [GregorianCalendar-class](#), [JulianCalendar-class](#), [RataDie-class](#), [TimeScale-class](#), [TimeSeries-class](#)

Other time classes: [RataDie-class](#), [TimeSeries-class](#)

---

|                 |                  |
|-----------------|------------------|
| TimeScale-class | <i>TimeScale</i> |
|-----------------|------------------|

---

**Description**

A virtual S4 class to represent a calendar.

**Slots**

label A [character](#) string specifying the abbreviated label of the time scale.

name A [character](#) string specifying the name of the time scale.

epoch A [numeric](#) value specifying the epoch year from which years are counted (starting date of the calendar, in years). Allows to define multiple era of a calendar.

fixed A [numeric](#) value specifying the reference date of the calendar (in *rata die*).

direction An [integer](#) specifying if years are counted backwards (-1) or forwards (1) from epoch.

year A [numeric](#) value giving the average length of the year in solar days.

**Author(s)**

N. Frerebeau

|------------------|-------------------|
| TimeSeries-class | <i>TimeSeries</i> |
|------------------|-------------------|

---

**Description**

An S4 class to represent time series.

**Details**

A time series object is an  $n \times m \times p$  array, with  $n$  being the number of observations,  $m$  being the number of series and with the  $p$  columns of the third dimension containing extra variables for each series.

**Slots**

.Data A  $n \times m \times p$  numeric [array](#) giving the observed time-series values.  
 .Time A length- $n$  [RataDie](#) object.

**Note**

This class inherits from [array](#).

**Author(s)**

N. Frerebeau

**See Also**

Other classes: [GregorianCalendar-class](#), [JulianCalendar-class](#), [RataDie-class](#), [TimeIntervals-class](#), [TimeScale-class](#)

---

|        |                     |
|--------|---------------------|
| window | <i>Time Windows</i> |
|--------|---------------------|

---

**Description**

Extracts the subset of the object  $x$  observed between the times `start` and `end` (expressed in *rata die*).

**Usage**

```
## S4 method for signature 'TimeSeries'
window(x, start = NULL, end = NULL, ...)
```

**Arguments**

|       |   |
|-------|---|
| x     | A <code>TimeSeries</code> object.   |
| start | A length-one <code>numeric</code> vector specifying the start time of the period of interest. |
| end   | A length-one <code>numeric</code> vector specifying the end time of the period of interest.   |
| ...   | Currently not used.   |

**Value**

A `TimeSeries` object.

**Author(s)**

N. Frerebeau

**See Also**

Other tools: `span()`, `start()`, `time()`

**Examples**

```
## Create 3 time-series of 100 observations
## Sampled every years starting from 1000 CE
(x <- series(matrix(rnorm(300), 100, 3), time = 1000:1099, calendar = CE()))

## Subset between 1025 and 1050 CE
(y <- window(x, start = 374009, end = 383140))
```

---

year\_axis

*Time Series Plotting Functions*

---

**Description**

Time Series Plotting Functions

**Usage**

```
year_axis(
  side,
  at = NULL,
  format = c("a", "ka", "Ma", "Ga"),
  labels = TRUE,
  calendar = getOption("aion.last_calendar"),
  current_calendar = getOption("aion.last_calendar"),
  ...
)
```

**Arguments**

|                  |  |
|------------------|--|
| side             | An <a href="#">integer</a> specifying which side of the plot the axis is to be drawn on. The axis is placed as follows: 1=below, 2=left, 3=above and 4=right.                      |
| at               | A <a href="#">numeric</a> vector giving the points at which tick-marks are to be drawn. If NULL, tickmark locations are computed.  |
| format           | A <a href="#">character</a> string specifying the prefix. It should be one of "a", "ka", "Ma" or "Ga". If TRUE, a good guess for an appropriate format is made.                    |
| labels           | A <a href="#">logical</a> scalar specifying whether annotations are to be made at the tick-marks, or a vector of <a href="#">character</a> strings to be placed at the tickpoints. |
| calendar         | A <a href="#">TimeScale</a> object specifying the target calendar (see <a href="#">calendar()</a> ).   |
| current_calendar | A <a href="#">TimeScale</a> object specifying the calendar used by the last call to <a href="#">plot()</a> .   |
| ...              | Further parameters to be passed to <a href="#">graphics::axis()</a> . (e.g. <a href="#">graphical parameters</a> ).  |

**Value**

year\_axis() is called it for its side-effects.

**Author(s)**

N. Frerebeau

**See Also**

Other plotting tools: [image\(\)](#), [plot\(\)](#)

**Examples**

```
## Create a time-series of 300 observations
## Sampled every two years starting from 2000 BP
X <- series(
  object = rnorm(300),
  time = seq(2000, by = -2, length.out = 300),
  calendar = BP()
)

## Axis
plot(X, axes = FALSE, calendar = BP()) # Remove axes
year_axis(side = 1) # Same calendar as last plot
year_axis(side = 3, calendar = CE()) # Specific calendar
mtext(format(CE()), side = 3, line = 3)

## Grid
plot(X, panel.first = graphics::grid())
```
