

# Package ‘DEGreport’

October 17, 2017

**Version** 1.12.0

**Date** 2017-04-10

**Type** Package

**Title** Report of DEG analysis

**Description** Creation of a HTML report of differential expression analyses of count data. It integrates some of the code mentioned in DESeq2 and edgeR vignettes, and report a ranked list of genes according to the fold changes mean and variability for each selected gene.

**biocViews** DifferentialExpression, Visualization, RNASeq, ReportWriting, GeneExpression

**Suggests** biomaRt, RUnit, BiocStyle, BiocGenerics, org.Hs.eg.db, DESeq2, AnnotationDbi, BiocParallel

**Depends** R (>= 3.2.0), quantreg

**Imports** utils, methods, ggplot2, ggrepel, Nozzle.R1, coda, edgeR, cluster, logging, dplyr, tidyr, reshape, pheatmap, grid, gridExtra, knitr, grDevices, stats

**Maintainer** Lorena Pantano <lorena.pantano@gmail.com>

**License** MIT + file LICENSE

**VignetteBuilder** knitr

**RxygenNote** 5.0.1

**NeedsCompilation** no

**Author** Lorena Pantano [aut, cre],  
John Hutchinson [ctb],  
Victor Barrera [ctb],  
Mary Piper [ctb]

---

**createReport***Create report of RNAseq DEG analysis*

---

**Description**

This function get the count matrix, pvalues, and FC of a DEG analysis and create a report to help to detect possible problems with the data.

**Usage**

```
createReport(g1, g2, counts, tags, pvalues, fc, path, colors = "",  
pop = 400, name = "DEGreport", ncores = NULL)
```

**Arguments**

g1	group 1
g2	group 2
counts	matrix with counts for each samples and each gene. Should be same length than pvalues vector.
tags	genes of DEG analysis
pvalues	pvalues of DEG analysis
fc	FC for each gene
path	path to save the figure
colors	data frame with colors for each gene
pop	random genes for background
name	name of the html file
ncores	num cores to be used to create report

**Value**

create a html file with all figures and tables

degBI	<i>Get the estimates of the fold change (FC) mean from a FC distribution using bayesian inference</i>
-------	---

**Description**

Get the estimates of the fold change (FC) mean from a FC distribution using bayesian inference

**Usage**

```
degBI(fc, iter = 1000, ncores = NULL)
```

**Arguments**

fc	list of FC
iter	number of iteration in the mcmc model
ncores	number of cores to use

**Value**

matrix with values from [degBICmd](#)

degBICmd	<i>Apply bayesian inference to estimate the average fold change (FC) of a distribution</i>
----------	--

**Description**

code based on <http://www.johnmyleswhite.com/notebook/2010/08/20/using-jags-in-r-with-the-rjags-package/> [http://public.wsu.edu/~jesse.brunner/classes/bio572/Lab7\\_Bayesian.html](http://public.wsu.edu/~jesse.brunner/classes/bio572/Lab7_Bayesian.html)

**Usage**

```
degBICmd(x, iter = 1000)
```

**Arguments**

x	list of values
iter	number of iteration in the mcmc model

**Value**

vector with mu and its confidence intervals (2.5

**degCheckFactors**      *Distribution of gene ratios used to calculate Size Factors.*

### Description

Distribution of gene ratios used to calculate Size Factors.

### Usage

```
degCheckFactors(counts)
```

### Arguments

counts	matrix with counts for each samples and each gene. row number should be the same length than pvalues vector.
--------	--

### Details

This function will plot the gene ratios for each sample. To calculate the ratios, it follows the similiar logic than DESeq2/edgeR uses, where the expression of each gene is divided by the mean expression of that gene. The distribution of the ratios should approximate to a normal shape and the factors should be similar to the median of distributions. If some samples show different distribution, the factor may be bias due to some biological or technical factor.

### Value

ggplot2 object

### Examples

```
data(DEGreportSet)
degCheckFactors(DEGreportSet$counts[,1:10])
```

**degComb**      *Get random combinations of two groups*

### Description

Get random combinations of two groups

### Usage

```
degComb(g1, g2, pop)
```

### Arguments

g1	list of samples in group 1
g2	list of samples in group 2
pop	number of combinations to be return

**Value**

matrix with different combinatios of two vector

---

degFC	<i>get the FC for each gene between two groups</i>
-------	--

---

**Description**

get the FC for each gene between two groups

**Usage**

```
degFC(g1, g2, counts, popsize)
```

**Arguments**

g1	list of samples in group 1
g2	list of samples in group 2
counts	count matrix of deregulated genes
popsize	number of combinations to generate

**Value**

FC for different combinations of samples in each group for each gene

---

degMB	<i>Distribution of expression of DE genes compared to the background</i>
-------	--

---

**Description**

Distribution of expression of DE genes compared to the background

**Usage**

```
degMB(tags, g1, g2, counts, pop = 400)
```

**Arguments**

tags	list of genes that are DE
g1	list of samples in group 1
g2	list of samples in group 2
counts	matrix with counts for each samples and each gene Should be same length than pvalues vector
pop	number of random samples taken for background comparison

**Value**

ggplot2 object

## Examples

```
data(DEGreportSet)
detag <- row.names(DEGreportSet$deg[1:10,])
degMB(detag,DEGreportSet$g1,DEGreportSet$g2,DEGreportSet$counts)
```

**degMean**

*Distribution of pvalues by expression range*

## Description

Distribution of pvalues by expression range

## Usage

```
degMean(pvalues, counts)
```

## Arguments

pvalues	pvalues of DEG analysis
counts	matrix with counts for each samples and each gene. row number should be the same length than pvalues vector.

## Value

ggplot2 object

## Examples

```
data(DEGreportSet)
degMean(DEGreportSet$deg[, 4],DEGreportSet$counts)
```

**degMerge**

*Integrate data comming from degPattern into one data object*

## Description

The simplest case is if you want to convine the pattern profile for gene expression data and proteomic data. It will use the first element as the base for the integration. Then, it will loop through clusters and run [degPatterns](#) in the second data set to detect patterns that match this one.

## Usage

```
degMerge(matrix_list, cluster_list, metadata_list, summarize = "group",
         time = "time", col = "condition", scale = TRUE, mapping = NULL)
```

**Arguments**

<code>matrix_list</code>	list expression data for each element
<code>cluster_list</code>	list df item from degPattern output
<code>metadata_list</code>	list data.frames from each element with design experiment. Normally colData output
<code>summarize</code>	character column to use to group samples
<code>time</code>	character column to use as x-axes in figures
<code>col</code>	character column to color samples in figures
<code>scale</code>	boolean scale by row expression matrix
<code>mapping</code>	data.frame mapping table in case elements use different ID in the row.names of expression matrix. For instance, when integrating miRNA/mRNA.

**Value**

A data.frame with information on what genes are in each cluster in all data set, and the correlation value for each pair cluster comparison.

<code>degMV</code>	<i>Correlation of the standard desviation and the mean of the abundance of a set of genes.</i>
--------------------	--

**Description**

Correlation of the standard desviation and the mean of the abundance of a set of genes.

**Usage**

```
degMV(group, pvalues, counts, sign = 0.01)
```

**Arguments**

<code>group</code>	character vector with group name for each sample in the same order than counts column names.
<code>pvalues</code>	pvalues of DEG analysis
<code>counts</code>	matrix with counts for each samples and each gene.
<code>sign</code>	defining the cutoff to label significant features. row number should be the same length than pvalues vector.

**Value**

ggplot2 object

**Examples**

```
data(DEGreportSet)
degMV(c(rep("M", length(DEGreportSet$g1)), rep("F", length(DEGreportSet$g2))),
      DEGreportSet$deg[,4],
      DEGreportSet$counts)
```

degNcomb

*Get number of potential combinations of two vectors***Description**

Get number of potential combinations of two vectors

**Usage**

```
degNcomb(g1, g2)
```

**Arguments**

- |    |                            |
|----|----------------------------|
| g1 | list of samples in group 1 |
| g2 | list of samples in group 2 |

**Value**

maximum number of combinations of two vectors

degObj

*Create a deg object that can be used to plot expression values at shiny server:runGist(9930881)***Description**

Create a deg object that can be used to plot expression values at shiny server:runGist(9930881)

**Usage**

```
degObj(counts, design, outfile)
```

**Arguments**

- |         |                                   |
|---------|-----------------------------------|
| counts  | output from get_rank function     |
| design  | colour used for each gene         |
| outfile | file that will contain the object |

**Value**

R object to be load into vizExp

**Examples**

```
data(DEGreportSet)
de = data.frame(row.names=colnames(DEGreportSet$counts),
               sex = c(rep("M", length(DEGreportSet$g1)),
                      rep("F", length(DEGreportSet$g2))))
degObj(DEGreportSet$counts, de, NULL)
```

---

degPatterns	<i>Make groups of genes using expression profile</i>
-------------	--

---

**Description**

Make groups of genes using expression profile

**Usage**

```
degPatterns(ma, metadata, minc = 15, summarize = "group", time = "time",
            col = "condition", reduce = FALSE, cutoff = 0.7, scale = TRUE,
            plot = TRUE, fixy = NULL)
```

**Arguments**

ma	log2 normalized count matrix
metadata	data frame with sample information. Rownames should match ma column names row number should be the same length than p-values vector.
minc	integer minimum number of genes in a group that will be return
summarize	character column name in metadata that will be used to gorup replicates. For instance, a merge between summarize and time parameters: control_point0 ... etc
time	character column name in metadata that will be used as variable that changes, normally a time variable.
col	character column name in metadata to separate samples. Normally control/mutant
reduce	boolean reduce number of clusters using correlation values between them.
cutoff	integer threshold for correlation expression to merge clusters (0 - 1)
scale	boolean scale the ma values by row
plot	boolean plot the clusters found
fixy	vector integers used as ylim in plot

**Details**

It would be used [diana](#) function to detect a value to cut the expression based clustering at certain height. It can work with one or more groups with 2 or more several time points. The different patterns can be merged to get similar ones into only one pattern. The expression correlation of the patterns will be used to decide whether some need to be merged or not.

**Value**

list wiht two items. df is a data.frame with two columns. The first one with genes, the second with the clusters they belong. pass\_to\_plot is a vector of the clusters that pass the minc cutoff.

**Examples**

```
data(humanSexDEdgeR)
ma <- humanSexDEdgeR$counts[1:100,]
des <- data.frame(row.names=colnames(ma),
group=as.factor(humanSexDEdgeR$samples$group))
res <- degPatterns(ma, des, time="group", col=NULL)
```

<code>degPlot</code>	<i>Plot top genes allowing more variables to color and shape points</i>
----------------------	---

**Description**

Plot top genes allowing more variables to color and shape points

**Usage**

```
degPlot(dds, res, n = 9, xs = "time", group = "condition", batch = NULL)
```

**Arguments**

<code>dds</code>	<a href="#">DESeqDataSet</a> object
<code>res</code>	<a href="#">DESeqResults</a> object
<code>n</code>	integer number of genes to plot.
<code>xs</code>	character, colname in colData that will be used as X-axes
<code>group</code>	character, colname in colData to color points and add different lines for each level
<code>batch</code>	character, colname in colData to shape points, normally used by batch effect visualization

**Value**

ggplot showing the expression of the genes

<code>degPlotWide</code>	<i>Plot selected genes on a wide format</i>
--------------------------	---

**Description**

Plot selected genes on a wide format

**Usage**

```
degPlotWide(dds, genes, group = "condition", batch = NULL)
```

**Arguments**

<code>dds</code>	<a href="#">DESeqDataSet</a> object
<code>genes</code>	character genes to plot.
<code>group</code>	character, colname in colData to color points and add different lines for each level
<code>batch</code>	character, colname in colData to shape points, normally used by batch effect visualization

**Value**

ggplot showing the expression of the genes on the x axis

**Examples**

```
data(humanSexDEedgeR)
library(DESeq2)
idx <- c(1:10, 75:85)
dse <- DESeqDataSetFromMatrix(humanSexDEedgeR$counts[1:1000, idx],
humanSexDEedgeR$samples[idx,], design=~group)
dse <- DESeq(dse)
degPlotWide(dse, rownames(dse)[1:10], group="group")
```

degPR

*plot the correlation between the rank according estimator and the rank according FC*

**Description**

plot the correlation between the rank according estimator and the rank according FC

**Usage**

```
degPR(rank, colors = "")
```

**Arguments**

rank	output from degRank function
colors	colour used for each gene

**Value**

ggplot2 object

**Examples**

```
data(DEGreportSet)
degPR(DEGreportSet$rank)
```

**degQC***Plot main figures showing p-values distribution and mean-variance correlation***Description**

This function joins the output of `degMean`, `degVar` and `degMV` in a single plot. See these functions for further information.

**Usage**

```
degQC(pvalue, counts, groups)
```

**Arguments**

<code>pvalue</code>	pvalues of DEG analysis
<code>counts</code>	matrix with counts for each samples and each gene.
<code>groups</code>	character vector with group name for each sample in the same order than counts column names.

**Value**

```
ggplot2 object
```

**Examples**

```
library(DESeq2)
data(humanSexDEedgeR)
idx <- c(1:10, 75:85)
dse <- DESeqDataSetFromMatrix(humanSexDEedgeR$counts[1:1000, idx],
humanSexDEedgeR$samples[idx,], design=~group)
dse <- DESeq(dse)
res <- results(dse)
degQC(res$pvalue, counts(dse, normalized=TRUE), colData(dse)$group)
```

**degRank***Get rank data frame with best score on the top***Description**

Get rank data frame with best score on the top

**Usage**

```
degRank(g1, g2, counts, fc, popsize = 400, iter = 1000, ncores = NULL)
```

**Arguments**

g1	list of samples in group 1
g2	list of samples in group 2
counts	count matrix for each gene and each sample that is deregulated
fc	list of FC of deregulated genes. Should be same length than counts row.names
popsize	number of combinations to generate
iter	number of iteration in the mcmc model
ncores	number of cores to use

**Value**

data frame with the output of [degBICmd](#) for each gene

**Examples**

```
data(DEGreportSet)
#library(rjags)
#degRank(DEGreportSet$g1,DEGreportSet$g2,
#       DEGreportSet$counts[DEGreportSet$detag[1:5],],
#       DEGreportSet$deg[DEGreportSet$detag[1:5],1],400,500)
```

---

**DEGreportSet***List of process geuvadis data to test the package*

---

**Description**

It contains gene counts matrix, group1 of samples, group2 of samples, differential expression analysis table, set of genes, output from degRank function.

**Usage**

DEGreportSet

**Format**

List

**Author(s)**

Lorena Pantano, 2014-05-31

**Source**

gEUvadis

**degResults***Complete report from DESeq2 analysis***Description**

Complete report from DESeq2 analysis

**Usage**

```
degResults(res = NULL, dds, rlogMat = NULL, name, org = NULL,
FDR = 0.05, do_go = TRUE, FC = 0.1, group = "condition",
xs = "time", path_results = ".", contrast = NULL)
```

**Arguments**

<code>res</code>	output from <a href="#">results</a> function.
<code>dds</code>	<a href="#">DESeqDataSet</a> object.
<code>rlogMat</code>	matrix from <a href="#">rlog</a> function.
<code>name</code>	string to identify results
<code>org</code>	an organism annotation object, like <code>org.Mm.eg.db</code> . <code>NULL</code> if you want to skip this step.
<code>FDR</code>	int cutoff for false discovery rate.
<code>do_go</code>	boolean if GO enrichment is done.
<code>FC</code>	int cutoff for log2 fold change.
<code>group</code>	string column name in <code>colData(dds)</code> that separates samples in meaningful groups.
<code>xs</code>	string column name in <code>colData(dss)</code> that will be used as X axes in plots (i.e time)
<code>path_results</code>	character path where files are stored. <code>NULL</code> if you don't want to save any file.
<code>contrast</code>	list with character vector indicating the fold change values from different comparisons to add to the output table.

**Value**

`ggplot2` object

**Examples**

```
data(humanSexDEedgeR)
library(DESeq2)
idx <- c(1:10, 75:85)
dse <- DESeqDataSetFromMatrix(humanSexDEedgeR$counts[1:1000, idx],
humanSexDEedgeR$samples[idx,], design=~group)
dse <- DESeq(dse)
res <- degResults(dds=dse, name="test", org=NULL,
do_go=FALSE, group="group", xs="group", path_results = NULL)
```

---

**degVar***Distribution of pvalues by standard desviation range*

---

**Description**

Distribution of pvalues by standard desviation range

**Usage**

```
degVar(pvalues, counts)
```

**Arguments**

pvalues	pvalues of DEG analysis
counts	matrix with counts for each samples and each gene. row number should be the same length than pvalues vector.

**Value**

ggplot2 object

**Examples**

```
data(DEGreportSet)
degVar(DEGreportSet$deg[, 4], DEGreportSet$counts)
```

---

**degVB***Distribution of the standard desviation of DE genes compared to the background*

---

**Description**

Distribution of the standard desviation of DE genes compared to the background

**Usage**

```
degVB(tags, g1, g2, counts, pop = 400)
```

**Arguments**

tags	list of genes that are DE
g1	list of samples in group 1
g2	list of samples in group 2
counts	matrix with counts for each samples and each gene. Should be same length than pvalues vector.
pop	number of random samples taken for background comparison

**Value**

ggplot2 object

**Examples**

```
data(DEGreportSet)
detag <- row.names(DEGreportSet$deg[1:10,])
degVB(detag,DEGreportSet$g1,DEGreportSet$g2,DEGreportSet$counts)
```

**degVolcano**

*Create volcano plot from log2FC and adjusted pvalues data frame*

**Description**

Create volcano plot from log2FC and adjusted pvalues data frame

**Usage**

```
degVolcano(stats, side = "both",
           title = "Volcano Plot with Marginal Distributions", pval.cutoff = 0.05,
           lfc.cutoff = 1, shade.colour = "orange", shade.alpha = 0.25,
           point.colour = "gray", point.alpha = 0.75,
           point.outline.colour = "darkgray", line.colour = "gray",
           plot_text = NULL)
```

**Arguments**

stats	data.frame with two columns: logFC and Adjusted.Pvalue
side	plot UP, DOWN or BOTH de-regulated points
title	title for the figure
pval.cutoff	cutoff for the adjusted pvalue. Default 0.05
lfc.cutoff	cutoff for the log2FC. Default 1
shade.colour	background color. Default orange.
shade.alpha	transparency value. Default 0.25
point.colour	colours for points. Default gray
point.alpha	transparency for points. Default 0.75
point.outline.colour	Default darkgray
line.colour	Default gray
plot_text	data.frame with three columns: logFC, Pvalue, Gene name

**Details**

This function was mainly developed by @jnhutchinson.

**Value**

The function will plot volcano plot together with density of the fold change and p-values on the top and the right side of the volcano plot.

**Examples**

```
data(DEGreportSet)
stats = DEGreportSet$deg[,c("logFC", "PValue")]
degVolcano(stats)
```

---
