

# Package ‘MWASTools’

October 18, 2017

**Type** Package

**Title** MWASTools: an integrated pipeline to perform metabolome-wide association studies

**Version** 1.0.0

**Date** 2016-12-19

**Author** Andrea Rodriguez-

Martinez, Joram M. Posma, Rafael Ayala, Ana L. Neves, Jeremy K. Nicholson, Marc-Emmanuel Dumas

**Maintainer**

Andrea Rodriguez-Martinez <[andrea.rodriguez-martinez13@imperial.ac.uk](mailto:andrea.rodriguez-martinez13@imperial.ac.uk)>, Rafael Ayala <[r.ayala14@imperial.ac.uk](mailto:r.ayala14@imperial.ac.uk)>

**Description** MWAS provides a complete pipeline to perform metabolome-wide association studies. Key functionalities of the package include: quality control analysis of metabolic data; MWAS using different association models (partial correlations; generalized linear models); model validation using non-parametric bootstrapping; visualization of MWAS results; NMR metabolite identification using STOCSY.

**License** CC BY-NC-ND 4.0

**Depends** R(>= 3.4)

**Suggests** RUnit, BiocGenerics, knitr, BiocStyle, rmarkdown

**VignetteBuilder** knitr

**Imports** glm2, ppcor, qvalue, car, boot, grid, ggplot2, gridExtra, igraph, SummarizedExperiment, graphics, stats, utils

**biocViews** Metabolomics, Lipidomics, Cheminformatics, SystemsBiology, QualityControl

**NeedsCompilation** no

**LazyData** true

**Encoding** UTF-8

<b>CV_filter</b>	<i>Filter metabolic data by CV</i>
------------------	------------------------------------

---

## Description

This function allows filtering a matrix of metabolic variables based on the coefficient of variation (CV) of each variable across the quality control (QC) samples. See also function "QC\_CV()".

## Usage

```
CV_filter(metabo_SE, CV_metabo, CV_th = 0.30)
```

## Arguments

- metabo\_SE      SummarizedExperiment object. See "MWAS\_SummarizedExperiment()".
- CV\_metabo      numeric vector containing the CVs of the metabolic variables. See function "QC\_CV()".
- CV\_th            numeric value indicating the CV threshold. Only features with CV below CV\_th will be retained in the matrix.

## Value

A SummarizedExperiment object containing the CV-filtered metabolic\_data.

## References

Dumas ME, et al. (2006). Assessment of analytical reproducibility of  $^1\text{H}$  NMR spectroscopy based metabonomics for large-scale epidemiological research: the INTERMAP Study. *Analytical Chemistry*, 78, 2199-1208.

## Examples

```
## Load data
data(metabo_SE)

## Calculate CVs
CV_metabo <- QC_CV (metabo_SE)

## Filter metabolic_data by CV
metabo_CVfiltered <- CV_filter(metabo_SE, CV_metabo, CV_th = 0.30)
metabo_CVfiltered2 <- CV_filter(metabo_SE, CV_metabo, CV_th = 0.15)
```

metabo\_SE

*NMR plasma metabolic profiles dataset*

## Description

This SummarizedExperiment object contains the following information:

- An assay matrix containing the 1H NMR profiles (1.60 - 0.80 ppm) of 506 plasma samples from the FGENTCARD cohort and 10 identical quality control (QC) samples. The QC samples were prepared from a representative pool of the experimental samples, and were injected regularly throughout the run to ensure analytical reproducibility.
- A data.frame containing clinical information (age, gender, type II diabetes status and BMI) and sample class (i.e. experimental sample or QC sample) information for each sample row in the assay matrix.

## Usage

```
data(metabo_SE)
```

## Format

SummarizedExperiment

## Value

SummarizedExperiment

MS\_data

*Simulated LC-MS features*

## Description

A matrix with simulated LC-MS features (retention times in the first column, and mz values in the second column.)

## Usage

```
data(MS_data)
```

**Format**

Matrix

**Value**

Matrix

**MWAS\_barplot***Visualize MWAS results in a bar plot***Description**

This function creates a bar plot based on the output from "MWAS\_stats()". This function is designed to visualize MWAS results in the case of discrete metabolic variables (e.g. target GC/MS metabolites).

**Usage**

```
MWAS_barplot(MWAS_matrix, alpha_th = 0.05, width = NULL,
              scale_color = c("darkgray", "cornflowerblue", "firebrick1"),
              legend_labs = c("unchanged", "downregulated", "upregulated"),
              ylab = "sign*log(pFDR)", size_yaxis = 12, size_ylab = 12,
              size_names = 10, angle_names = 45, sort = TRUE)
```

**Arguments**

<code>MWAS_matrix</code>	numeric matrix resulting from the function "MWAS_stats()".
<code>alpha_th</code>	numeric value indicating the significance threshold.
<code>width</code>	numeric value indicating bar width.
<code>scale_color</code>	character vector corresponding to the 3-color scale that will be used to represent the association results. The first color of the scale indicates "no change", the second color indicates "downregulation", and the third color indicates "upregulation".
<code>legend_labs</code>	character vector containing the legend labels, according to <code>scale_color</code> .
<code>ylab</code>	character vector specifying a title for the y-axis.
<code>size_yaxis</code>	numeric value indicating the font size of y-axis title.
<code>size_ylab</code>	numeric value indicating the font size of y-axis labels.
<code>size_names</code>	numeric value indicating the font size of the metabolite ids displayed on the x-axis.
<code>angle_names</code>	numeric value indicating the angle in which the metabolite ids will be displayed on the x-axis.
<code>sort</code>	logical constant indicating whether the metabolites will be sorted based on MWAS results.

**Value**

A bar plot.

## Examples

```
## Load data
data(targetMetabo_SE)

## Test for association between diabetes and target_metabolites
T2D_model <- MWAS_stats (targetMetabo_SE, disease_id = "T2D",
                           confounder_ids = c("Age", "Gender", "BMI"),
                           assoc_method = "logistic")

## Bar plot
MWAS_barplot(T2D_model)
MWAS_barplot(T2D_model, width = 0.7) # change bar width
MWAS_barplot(T2D_model, width = 0.7, angle_names = 90)
```

MWAS\_bootstrapping      *MWAS bootstrap resampling*

## Description

This function generates bootstrap replicates (non-parametric resampling) of a model testing for association between a given metabolite and a disease phenotype, and calculates the confidence interval of model coefficients.

## Usage

```
MWAS_bootstrapping (metabo_SE, metabolite_id, disease_id, confounder_ids = NULL,
                     assoc_method, iterations = 10000)
```

## Arguments

<code>metabo_SE</code>	SummarizedExperiment object. See "MWAS_SummarizedExperiment()".
<code>metabolite_id</code>	character vector corresponding to the id of the metabolite to be modeled.
<code>disease_id</code>	character vector corresponding to the id of the response to be modeled.
<code>confounder_ids</code>	optional character vector corresponding to the ids of covariates to be included in the model (e.g. age or gender).
<code>assoc_method</code>	character constant indicating the association method that will be used. Possible values for <code>assoc_method</code> are: "pearson" (pearson correlation), "spearman" (spearman correlation), "kendall" (kendall correlation), "linear" (linear regression) or "logistic" (logistic regression).
<code>iterations</code>	numeric value indicating the number of bootstrap replicates

## Value

A list with 3 elements, each list element reporting the following information: i) object of class "boot"; ii) summary of the previous object; iii) 95-confidence interval of the metabolite model coefficient. For more details, check the function "boot()" from the "boot" package.

## References

Davison AC, Hinkley, DV. (1997). Bootstrap Methods and Their Application. Cambridge University Press.

## Examples

```
## Load data
data(targetMetabo_SE)

## Bootstrap model testing for association between diabetes (T2D) and 30H-butyrate
MWAS_bootstrapping (targetMetabo_SE, metabolite_id = "30H-butyrate", disease_id = "T2D",
                      assoc_method = "logistic", iterations = 1000)
```

MWAS\_filter

*Filter MWAS results by p-value and/or CV*

## Description

This function allows filtering the output matrix from "MWAS\_stats()", by p-value and/or coefficient of variation (CV).

## Usage

```
MWAS_filter(MWAS_matrix, type = "pvalue", alpha_th = 0.05, CV_th = 0.30, sort = FALSE)
```

## Arguments

MWAS_matrix	numeric matrix generated by the function "MWAS_stats()".
type	character constant indicating the filtering criteria. If type = "pvalue", only metabolic variables with p-value below alpha_th will be retained in the MWAS_matrix. If type = "CV", only metabolic variables with CV below CV_th will be retained. If type = "all", only metabolic variables with CV below CV_th and p-value below alpha_th will be retained.
alpha_th	numeric value indicating the significance threshold.
CV_th	numeric value indicating the CV threshold.
sort	logical constant indicating whether the filter MWAS_matrix will be sorted based on p-values.

## Value

A numeric matrix corresponding to the filtered MWAS\_matrix. The matrix has an additional column, which indicates the index of each metabolic variable in the original MWAS\_matrix.

## Examples

```
## Load data
data(targetMetabo_SE)

## Test for association between diabetes and target_metabolites
T2D_model <- MWAS_stats (targetMetabo_SE, disease_id = "T2D",
                           assoc_method = "logistic")

## Filter T2D_model by p-value
MWAS_filter(T2D_model, type = "pvalue", alpha_th = 0.001, sort = TRUE)

## Subset targetMetabo_SE based on pvalue_filter
```

```
pvalue_filter <- MWAS_filter(T2D_model, type = "pvalue", alpha_th = 0.001)
index_features <- pvalue_filter[, 4]
targetMetabo_SE[index_features, ]
```

**MWAS\_network***Visualize MWAS results in a correlation-based metabolic network***Description**

This function allows visualizing MWAS results in a correlation-based metabolic network. The network is an undirected graph where the nodes represent the metabolites, and the edges represent a co-abundance relationship between pairs of nodes. Different node parameters (e.g. color, size) can be customized based on MWAS results.

**Usage**

```
MWAS_network (metabo_SE, MWAS_matrix, alpha_th = 0.05, cor_th = 0.25,
               file_name = "MWAS", res_cor = 2)
```

**Arguments**

<code>metabo_SE</code>	SummarizedExperiment object. See "MWAS_SummarizedExperiment()".
<code>MWAS_matrix</code>	numeric matrix generated by the function "MWAS_stats()".
<code>alpha_th</code>	numeric value indicating MWAS significance threshold.
<code>cor_th</code>	numeric value indicating the co-abundance similarity threshold. Thus, two metabolites will be linked in the network if the absolute correlation (Pearson) between them exceeds <code>cor_th</code> .
<code>file_name</code>	character string indicating the name given to the cytoscape files that will be exported to the working directory.
<code>res_cor</code>	numeric value restricting the number of decimals of the correlation of coefficients used to build the edges of the network.

**Value**

A correlation based-metabolic network formalized as a weighted igraph object. This igraph object contains two node attributes: "score" and "color". "score" is a vector containing the MWAS score (-log10(pvalue)\*estimate sign) of each metabolite. "color" is a vector indicating the color of each node based on MWAS results ("cornflowerblue": "downregulation", "gray": "no change", "firebrick1": "upregulation"). These attributes can be used to customize node parameters based on MWAS results. The function also exports a network file ("MWASNNetwork.txt") and an attribute file ("MWASAttribute.txt") of MWAS scores, which can be imported into cytoscape to visualize the network.

**References**

Csardi, G. & Nepusz, T. (2006). The igraph software package for complex network research. *InterJournal, Complex Systems*, 1695.

## Examples

```

## Load data
data(targetMetabo_SE)

## Test for association between diabetes and target_metabolites
T2D_model <- MWAS_stats (targetMetabo_SE, disease_id = "T2D",
                           confounder_ids = c("Age", "Gender", "BMI"),
                           assoc_method = "logistic")

## Build correlation-based metabolic network
net_T2D <- MWAS_network(targetMetabo_SE, T2D_model, file_name = "MWAS_T2D",
                         cor_th = 0.30)

## Visualize network using the igraph package
# library(igraph)
# plot(net_T2D, vertex.size = abs(V(net_T2D)$score*6)) # node size based on scores

# plot(net_T2D, vertex.size = abs(V(net_T2D)$score*6),
#      edge.label = E(net_T2D)$weight) # show edge labels

```

MWAS\_scatterplotMS      *Visualize MWAS results in MS-based scatter plot*

## Description

This function creates a MS-based scatter plot (rt vs mz) based on the output from "MWAS\_stats()". MS-features are filtered according to a given significance threshold and only significant features are represented in the scatter plot. The color of the marker representing each significant MS feature indicates the direction of the association (i.e. downregulation or upregulation) and the size of the marker indicates the strength of the association (i.e. -log10(p-value)).

## Usage

```
MWAS_scatterplotMS (rt, mz, MWAS_matrix, alpha_th = 0.05, xlab = "rt",
                     ylab = "mz", pch = 20, scale_color = c("cornflowerblue", "red"),
                     xlim = NULL, ylim = NULL, size_axis = 10, size_lab = 10,
                     legend_position = "bottom")
```

## Arguments

<code>rt</code>	numeric vector of retention time values.
<code>mz</code>	numeric vector of mz values.
<code>MWAS_matrix</code>	numeric matrix resulting from the function "MWAS_stats()". The dimensions of this matrix must be consistent with the length of <code>rt</code> and <code>mz</code>
<code>alpha_th</code>	numeric value indicating the significance threshold. Only variables with p-value (corrected for multiple-testing) below <code>alpha_th</code> will be plotted.
<code>xlab</code>	character vector specifying a title for the x-axis.
<code>ylab</code>	character vector specifying a title for the y-axis.
<code>pch</code>	value specifying the symbol used to represent each MS feature in the scatter plot. To see all possible symbols, check "plot()" options.

scale_color	character vector corresponding to the 2-color scale that will be used to represent the association results. The first color of the scale indicates "downregulation", and the second color indicates "upregulation".
xlim	numeric vector containing the minimum and maximum values of the x-axis.
ylim	numeric vector containing the minimum and maximum values of the y-axis.
size_axis	numeric value indicating the font size of x- and y-axis title.
size_lab	numeric value indicating the font size of x- and y-axis labels.
legend_position	character vector indicating the position of the legend: "top", "bottom", "right", "left", "none".

### Value

A MS-based scatter plot where MS features are represented according to MWAS\_results.

### Examples

```
## Load data
data(MS_data)
rt <- MS_data[, 1]
mz <- MS_data[, 2]

## Simulate MWAS data
set.seed(100)
estimates <- runif(length(rt), -1, 1)
pvalues <- rbeta(length(estimates), 0.5, 1)
pFDR <- p.adjust(pvalues, method = "BH")
MWAS_matrix <- cbind(estimates, pvalues, pFDR)

## MS-based scatter plot
MWAS_scatterplotMS(rt, mz, MWAS_matrix)
MWAS_scatterplotMS(rt, mz, MWAS_matrix, alpha_th = 0.01)
MWAS_scatterplotMS(rt, mz, MWAS_matrix, alpha_th = 0.01,
                    scale_color = c("yellow", "blue"))
```

### Description

This function generates a 2-panel figure showing the results from "MWAS\_stats()" applied to NMR data. The upper panel shows an NMR-skyline plot (comparable to a GWAS-Manhattan plot), where the chemical shifts are displayed along the x-axis and the -log10 p-values (sign-adjusted for the direction of the association) are displayed on the y-axis. The lower panel shows an NMR spectrum colored according to MWAS results.

## Usage

```
MWAS_skylineNMR (metabo_SE, MWAS_matrix, ref_sample, alpha_th = 0.05, output = "all",
  xlab ="ppm", ylab1 = "sign*log(pFDR)", ylab2 = "intensity", pch = 20,
  marker_size = 1, scale_color = c("black", "cornflowerblue", "red"),
  size_lab = 12, size_axis = 12, xlim = NULL, ylim1 = NULL,
  ylim2 = NULL, guide_type = "legend", xbreaks = waiver(),
  xnames = waiver(), ybreaks1 = waiver(), ybreaks2 = waiver(),
  ynames1 = waiver(), ynames2 = waiver())
```

## Arguments

metabo_SE	SummarizedExperiment object. See "MWAS_SummarizedExperiment()".
MWAS_matrix	numeric matrix resulting from the function "MWAS_stats()".
ref_sample	character vector indicating the id of the sample that will be used to plot the NMR spectrum.
alpha_th	numeric value indicating the significance threshold.
output	character constant indicating the outcome of the function ("skyline", "spectrum" or "all"). If outcome = "all", both the skyline and the spectrum will be plotted in a 2-panel plot.
xlab	character vector specifying a title for the x-axis.
ylab1	character vector specifying a title for the y-axis of the upper panel.
ylab2	character vector specifying a title for the y-axis of the lower panel.
pch	value specifying the symbol used to represent each ppm value in the skyline plot. To see all possible symbols, check "plot()" options.
marker_size	numeric value indicating the size of the symbol used to represent each ppm value in the skyline plot.
scale_color	character vector corresponding to the 3-color scale that will be used to represent the association results. The first color of the scale indicates "no change", the second color indicates "downregulation", and the third color indicates "upregulation".
size_lab	numeric value indicating the font size of x- and y-axis titles.
size_axis	numeric value indicating the font size of x- and y-axis labels.
xlim	numeric vector containing the minimum and maximum values of the x-axis. Notice that ppm is displayed in reverse scale (e.g. xlim = c(5, 2)).
ylim1	numeric vector containing the minimum and maximum values of the y-axis for the upper panel.
ylim2	numeric vector containing the minimum and maximum values of the y-axis for the lower panel.
guide_type	character constant indicating the guide ("legend" or "none") that will be added to the plots.
xbreaks	numeric vector indicating the positions of the breaks of the x-axis.
xnames	character vector (same length as xbreaks) containing the labels of each break of the x-axis.
ybreaks1	numeric vector indicating the positions of the breaks of the y-axis for the upper panel.

ybreaks2	numeric vector indicating the positions of the breaks of the y-axis for the lower panel.
ynames1	character vector (same length as ybreaks1) containing the labels of each break of the y-axis for the upper panel.
ynames2	character vector (same length as ybreaks2) containing the labels of each break of the y-axis for the lower panel.

### Value

By default, a plot with 2 panels, the upper panel showing an NMR-skyline plot and the lower panel showing an NMR spectrum colored based on MWAS results.

### References

Elliott P, et al. (2015). Urinary metabolic signatures of human adiposity. *Science Translational Medicine*, 7, 285ra62.

### Examples

```
## Load data
data(metabo_SE)

## Test for association between BMI and metabolic_data
BMI_model <- MWAS_stats (metabo_SE, disease_id = "BMI", assoc_method = "spearman",
                           output = "pvalues")

## Create skyline plots
MWAS_skylineNMR (metabo_SE, BMI_model, ref_sample = "QC1")
MWAS_skylineNMR (metabo_SE, BMI_model, ref_sample = "QC1", pch = "*", marker_size = 3)
```

### Description

This function tests for association between individual metabolites and a disease phenotype.

### Usage

```
MWAS_stats (metabo_SE, disease_id, confounder_ids = NULL, assoc_method, mt_method = "BH",
            output = "pvalues", CV_metabo = NULL)
```

### Arguments

metabo_SE	SummarizedExperiment object. See "MWAS_SummarizedExperiment()".
disease_id	character vector corresponding to the id of the response to be modeled.
confounder_ids	optional character vector corresponding to the ids of the covariates to be included in the model (e.g. age or gender).
assoc_method	character constant indicating the association method that will be used. Possible values for assoc_method are: "pearson" (Pearson correlation), "spearman" (Spearman correlation), "kendall" (Kendall correlation), "linear" (linear regression) or "logistic" (logistic regression).

<code>mt_method</code>	character constant indicating the multiple-testing correction method that will be used. Possible values for <code>mt_method</code> are: "BH" (Benjamini and Hochberg), "bonferroni", "holm", "hochberg", "hommel", "BY" (Benjamini and Yekutieli), "qvalues", or "none".
<code>output</code>	character constant indicating the output of the function. If <code>output</code> = "pvalues", p-values and estimates for each metabolic variable will be returned as a matrix. If <code>output</code> = "models", detailed information about the statistical model fitted for each metabolic variable will be returned.
<code>CV_metabo</code>	optional numeric vector containing the coefficients of variation of the metabolic variables. This vector will be added as an additional column of the output matrix.

## Value

By default, a matrix where each row contains the model coefficient estimate and the p-value obtained for each metabolic variable. When output = "models", the function returns a list, each list element containing detailed information about the statistic model fitted for each metabolic variable.

assoc_method = "logistic", mt_method = "BY",
output = "pvalues")
```

**MWAS\_SummarizedExperiment***Create a SummarizedExperiment object***Description**

This function formats the metabolic and clinical data into a SummarizedExperiment object.

**Usage**

```
MWAS_SummarizedExperiment(metao_matrix, clinical_matrix, sample_type)
```

**Arguments**

- `metao_matrix` numeric matrix containing the metabolic data (e.g. NMR peak intensities or metabolite concentrations). The columns of the matrix must correspond to the metabolic variables and the rows to the samples. Column and row names must contain the metabolite ids (e.g. chemical shifts for NMR data) and the sample ids, respectively.
- `clinical_matrix` numeric matrix containing the clinical data (e.g. age, gender). The columns of the matrix must correspond to the phenotypic variables and the rows to the samples. Column and row names must contain the phenotype ids and the sample ids, respectively. For samples without clinical data (e.g. quality control (QC) samples), NA values must be used.
- `sample_type` numeric vector indicating sample type (i.e. experimental sample or QC sample). The vector must be coded as follows: experimental sample = 0, QC sample = 1. If QC samples are not available, all the elements of this vector must be 0.

**Value**

A SummarizedExperiment object.

**References**

Morgan M, et al. (2016). SummarizedExperiment: SummarizedExperiment container. R package.

**Examples**

```
## Load data
data(metao_SE)

## Get metabolic_data, clinical_data, and sample_type
library(SummarizedExperiment)
metabolic_data = t(assays(metao_SE)$metabolic_data)
clinical_data = as.matrix(colData(metao_SE)[, -5])
sample_type = as.vector(colData(metao_SE)[, 5])

## Reconstruct SummarizedExperiment
```

```
data_SE = MWAS_SummarizedExperiment(metabolic_data, clinical_data,
                                     sample_type)
```

**plot\_spectraNMR***Plot NMR spectra***Description**

This function generates an NMR spectra plot, with the chemical shifts displayed along the x-axis, and the peak intensities displayed on the y-axis.

**Usage**

```
plot_spectraNMR (metabo_SE, type = "l", lty = 1, xlab ="ppm",
                  ylab ="intensity", xlim = NULL, ...)
```

**Arguments**

<code>metabo_SE</code>	SummarizedExperiment object. See "MWAS_SummarizedExperiment()".
<code>type</code>	character vector indicating the type of plot for each row of <code>metabo_matrix</code> . For all possible types, see "plot()".
<code>lty</code>	character vector of line types. For all possible types, see "plot()".
<code>xlab</code>	character vector specifying a title for the x-axis.
<code>ylab</code>	character vector specifying a title for the y-axis.
<code>xlim</code>	numeric vector containing the minimum and maximum values of the x axis. Notice that ppm is displayed in reverse scale (e.g. <code>xlim = c(10, 0)</code> ).
<code>...</code>	other arguments passed to "matplot()".

**Value**

An NMR spectra plot.

**Examples**

```
## Load data
data(metabo_SE)

## Plot first 2 spectra
plot_spectraNMR (metabo_SE[, 1:2])
plot_spectraNMR (metabo_SE[, 1:2], xlim = c(1.03, 0.85), main = "NMR spectra")
```

---

QC_CV	<i>Calculate coefficients of variation</i>
-------	--

---

## Description

This function calculates the coefficient of variation (CV) ( $\text{lsd}/\text{meanl}$ ) of each metabolic feature across the quality control (QC) samples. The CV distribution is represented in a histogram. This function can be used to assess the reproducibility of individual metabolic features. Notice that  $\text{CV} = 0.30$  and  $\text{CV} = 0.15$  are the thresholds established by the FDA guidelines for biomarker discovery and quantification, respectively.

## Usage

```
QC_CV (metabo_SE, CV_th = 0.30, plot_hist = TRUE, hist_bw = 0.005,
       hist_col = "moccasin", size_lab = 12, size_axis = 12)
```

## Arguments

metabo_SE	SummarizedExperiment object. See "MWAS_SummarizedExperiment()".
CV_th	numeric value indicating the CV threshold.
plot_hist	logical constant indicating whether a histogram showing CV distribution will be plotted.
hist_bw	numeric value indicating histogram bin width.
hist_col	character string indicating the color to be used to fill the histogram bars.
size_lab	numeric value indicating the font size of x- and y-axis titles.
size_axis	numeric value indicating the font size of x- and y-axis labels.

## Value

A numeric vector containing the CV of each metabolic feature and a histogram showing CV distribution. In the histogram, CVs above 1 are set to 1.

## References

Dumas ME, et al. (2006). Assessment of analytical reproducibility of  $^1\text{H}$  NMR spectroscopy based metabolomics for large-scale epidemiological research: the INTERMAP Study. *Analytical Chemistry*, 78, 2199-1208.

## Examples

```
## Load data
data(metabo_SE)

## Calculate CVs
metabo_CV <- QC_CV (metabo_SE)
metabo_CV2 <- QC_CV (metabo_SE, hist_bw = 0.008, hist_col = "lightblue")
```

`QC_CV_scatterplot`      *Plot MS-based scatter plot colored based on CV*

## Description

This function creates a MS-based scatter plot (rt vs mz) where the metabolic features are colored based on their coefficient of variation (CV). See "QC\_CV()".

## Usage

```
QC_CV_scatterplot (rt, mz, CV_metabo, CV_th = 0.30, xlab = "rt",
                    ylab = "mz", pch = 20, marker_size = 1, xlim = NULL,
                    ylim = NULL, size_axis = 10, size_lab = 10)
```

## Arguments

<code>rt</code>	numeric vector of retention time values.
<code>mz</code>	numeric vector of mz values.
<code>CV_metabo</code>	numeric vector containing the CV of each metabolic feature. The length of this vector should be consistent with the length of <code>rt</code> and <code>mz</code> .
<code>CV_th</code>	numeric value indicating the CV threshold. NMR signals with CV equal or above <code>CV_th</code> will be colored in red.
<code>xlab</code>	character vector specifying a title for the x-axis.
<code>ylab</code>	character vector specifying a title for the y-axis.
<code>pch</code>	value specifying the symbol used to represent each MS feature in the scatter plot. To see all possible symbols, check "plot()" options.
<code>marker_size</code>	numeric value indicating the size of the symbol used to represent each metabolic feature in the scatter plot.
<code>xlim</code>	numeric vector containing the minimum and maximum values of the x-axis.
<code>ylim</code>	numeric vector containing the minimum and maximum values of the y-axis.
<code>size_axis</code>	numeric value indicating the font size of x- and y-axis title.
<code>size_lab</code>	numeric value indicating the font size of x- and y-axis labels.

## Value

A MS-based scatter plot where MS features are represented according on CV.

## Examples

```
## Load data
data(MS_data)
rt <- MS_data[, 1]
mz <- MS_data[, 2]

## Simulate CV values
CV_metabo <- runif(length(rt), 0.05, 0.31)

## MS-based scatter plot
QC_CV_scatterplot(rt, mz, CV_metabo)
QC_CV_scatterplot(rt, mz, CV_metabo, xlim = c(0, 10))
QC_CV_scatterplot(rt, mz, CV_metabo, CV_th = 0.15)
```

---

QC_CV_specNMR	<i>Plot NMR spectrum colored based on CV</i>
---------------	--

---

## Description

This function allows plotting a reference NMR spectrum colored based on the coefficient of variation (CV) of each NMR signal. See function "QC\_CV()".

## Usage

```
QC_CV_specNMR (metabo_SE, ref_sample, CV_th = 0.30, xlab = "ppm",
                 ylab = "intensity", size_axis = 12, size_lab = 12, xlim = NULL,
                 ylim = NULL, xbreaks = waiver (), xnames = waiver (),
                 ybreaks = waiver (), ynames = waiver ())
```

## Arguments

metabo_SE	SummarizedExperiment object. See "MWAS_SummarizedExperiment()".
ref_sample	character vector indicating the id of the sample that will be used to plot the NMR spectrum.
CV_th	numeric value indicating the CV threshold. NMR signals with CV equal or above CV_th will be colored in red.
xlab	character vector specifying a title for the x-axis.
ylab	character vector specifying a title for the y-axis.
size_axis	numeric vector indicating the font size of x- and y-axis labels.
size_lab	numeric vector indicating the font size of x- and y-axis tittles.
xlim	numeric vector containing the minimum and maximum values of the x-axis. Notice that ppm is displayed in reverse scaled (e.g. xlim = c(10, 0)).
ylim	numeric vector containing the minimum and maximum values of the y-axis.
xbreaks	numeric vector indicating the positions of the breaks of the x-axis.
xnames	character vector (same length as xbreaks) containing the labels of each break of the x-axis.
ybreaks	numeric vector indicating the positions of the breaks of the y-axis.
ynames	character vector (same length as ybreaks) containing the labels of each break of the y-axis.

## Value

An NMR spectrum plot colored based on the CV of each NMR signal.

## References

Dumas ME, et al. (2006). Assessment of analytical reproducibility of  $^1\text{H}$  NMR spectroscopy based metabonomics for large-scale epidemiological research: the INTERMAP Study. *Analytical Chemistry*, 78, 2199-1208.

## Examples

```
## Load data
data(metabo_SE)

## Plot NMR spectrum colored by CV
QC_CV_specNMR (metabo_SE, ref_sample = "QC1", CV_th = 0.30)
QC_CV_specNMR (metabo_SE, ref_sample = "QC1", CV_th = 0.30, xlim = c(1.1, 0.95))
QC_CV_specNMR (metabo_SE, ref_sample = "QC1", CV_th = 0.15)
```

## Description

This function performs PCA on a matrix of metabolic data and returns the results as an object of class "prcomp". When quality control (QC) samples are available, "QC\_PCA()" can be used to assess the stability and reproducibility of the dataset.

## Usage

```
QC_PCA (metabo_SE, scale = FALSE, center = TRUE, ...)
```

## Arguments

metabo_SE	SummarizedExperiment object. See "MWAS_SummarizedExperiment()".
scale	logical constant indicating whether the metabolic variables will be scaled to have unit variance before the analysis. For more details, check "prcomp()".
center	logical constant indicating whether the metabolic variables will be shifted to be zero-centered before the analysis. For more details, check "prcomp()".
...	other arguments passed to "prcomp()".

## Value

A list with class "prcomp". For more details, check "prcomp()".

## References

Mardia K, et al. (1979). Multivariate Analysis, London: Academic Press.

## Examples

```
## Load data
data(metabo_SE)
data(targetMetabo_SE)

## PCA model using all metabolic data
PCA_model <- QC_PCA (metabo_SE)

## PCA model using target metabolites
PCA_subset <- QC_PCA (targetMetabo_SE)
```

---

QC_PCA_scoreplot	<i>PCA score plot</i>
------------------	-----------------------

---

## Description

This function generates a PCA score plot colored based on sample type (i.e. experimental or quality control (QC) sample). The plots generated with this function can be used to assess analytical reproducibility and stability. If the dataset is reproducible, all quality control samples should appear clustered in the center of the Hotelling's ellipse.

## Usage

```
QC_PCA_scoreplot (PCA_model, metabo_SE, plot_labels = FALSE, px = 1, py = 2,
                    CI_level = 0.95, pch = 20, xlim = NULL, ylim = NULL,
                    color_scale = c("cornflowerblue", "red"), grid = TRUE, ...)
```

## Arguments

PCA_model	"prcomp" object generated by the function "QC_PCA()".
metabo_SE	SummarizedExperiment object. See "MWAS_SummarizedExperiment()".
plot_labels	logical constant indicating whether the sample ids will be displayed in the score plot.
px	numeric value indicating the index of the principal component that will be displayed on the x-axis.
py	numeric value indicating the index of the principal component that will be displayed on the y-axis.
CI_level	numeric value indicating the confidence interval for the Hotelling's ellipse.
pch	value specifying the symbol that will represent each sample in the score. To see all possible symbols, check "plot()" options.
xlim	numeric vector containing the minimum and maximum values of the x-axis.
ylim	numeric vector containing the minimum and maximum values of the y-axis.
color_scale	character vector corresponding to the 2-color scale that will be used to discriminate the experimental samples from the QC samples.
grid	logical constant indicating whether grid lines will be added to the plot.
...	other arguments passed to "plot()".

## Value

A PCA score plot.

## References

- Mardia K, et al. (1979). Multivariate Analysis, London: Academic Press.

## Examples

```

## Load data
data(metabo_SE)

## PCA model
PCA_model <- QC_PCA (metabo_SE)

## PCA score plots
QC_PCA_scoreplot (PCA_model, metabo_SE) # PC1 vs PC2
QC_PCA_scoreplot (PCA_model, metabo_SE, px = 3, py = 4) # PC3 vs PC4
QC_PCA_scoreplot(PCA_model, metabo_SE, plot_labels = TRUE) # show labels
QC_PCA_scoreplot (PCA_model, metabo_SE, CI_level = 0.80) # change CI

```

## Description

This function calculates STOCSY between an NMR signal of interest and all the NMR variables, representing a useful tool for NMR molecular identification and assignment. The results are represented in a pseudo-NMR spectrum displaying the covariance (height) and the Pearson correlation coefficient (color) of all spectral variables with the variable of interest (driver signal).

## Usage

```
STOCSY_NMR (metabo_SE, ppm_query, alpha_th = 0.05, xlab = "ppm", ylab = "covariance",
size_lab = 12, size_axis = 12, xlim = NULL, ylim = NULL, xbreaks = waiver(),
xnames = waiver(), ynames = waiver(), ybreaks = waiver())
```

## Arguments

metabo_SE	SummarizedExperiment object. See "MWAS_SummarizedExperiment()".
ppm_query	numeric value (at least 2 decimals) corresponding to the driver ppm.
alpha_th	numeric value indicating the significance threshold. NMR variables with BH-adjusted p-value above this threshold will be neglected.
xlab	character vector specifying a title for the x-axis.
ylab	character vector specifying a title for the y-axis.
size_lab	numeric value indicating the font size of x- and y- axis titles.
size_axis	numeric value indicating the font size of x- and y- axis labels.
xlim	numeric vector containing the minimum and maximum values of the x-axis. Notice that ppm is displayed in reverse scale (e.g. xlim = c(2, 1)).
ylim	numeric vector containing the minimum and maximum values of the y-axis.
xbreaks	numeric vector indicating the positions of the breaks of the x-axis.
xnames	character vector (same length as xbreaks) containing the labels of each break of the x-axis.
ybreaks	numeric vector indicating the positions of the breaks of the y-axis.
ynames	character vector (same length as ybreaks) containing the labels of each break of the y-axis.

**Value**

A plot displaying the Pearson correlation coefficient (color) and covariance (height) between all spectral variables and the driver signal.

**Examples**

```
## Load data
data(targetMetabo_SE)

## STOCSY using 1.04 as driver signal
STOCSY_NMR (targetMetabo_SE, ppm_query = 1.04)
STOCSY_NMR (targetMetabo_SE, ppm_query = 1.04, alpha_th = 0, xlim = c(1.06, 1))
```

---

targetMetabo\_SE

*Target NMR metabolites dataset*

---

**Description**

This SummarizedExperiment object contains the following information:

- An assay matrix containing the levels of 8 targeted 1H NMR metabolites (lactate, 3-hydroxybutyrate, leucine, valine, isoleucine, acetate, alanine and 1,5-anhydroglucitol) across the experimental samples and the quality control (QC) samples.
- A data.frame containing clinical information (age, gender, type II diabetes status and BMI) and sample class (i.e. experimental sample or QC sample) information for each sample row in the assay matrix.

**Usage**

```
data(targetMetabo_SE)
```

**Format**

SummarizedExperiment

**Value**

SummarizedExperiment
