Package 'NADfinder'

October 18, 2017

Type Package

Title Call wide peaks for sequencing data

Version 1.0.1

Date 2017-07-24

Author Jianhong Ou, Jun Yu, Anastassiia Vertii, Paul Kaufman, Lihua Julie Zhu

Maintainer Jianhong Ou <jianhong.ou@umassmed.edu>, Lihua Julie Zhu <julie.zhu@umassmed.edu>

Description Nucleolus is an important structure inside the nucleus in eukaryotic cells. It is the site for transcribing rDNA into rRNA and for assembling ribosomes, aka ribosome biogenesis. In addition, nucleoli are dynamic hubs through which numerous proteins shuttle and contact specific non-rDNA genomic loci. Deep sequencing analyses of DNA associated with isolated nucleoli (NAD-seq) have shown that specific loci, termed nucleolar-associated domains (NADs) form frequent three-dimensional associations with nucleoli. NAD-seq has been used to study the biological functions of NAD and the dynamics of NAD distribution during embryonic stem cell (ESC) differentiation.

Here, we developed a Bioconductor package NADfinder for bioinformatic analysis of the NAD-seq data, including normalization,

smoothing, peak calling, peak trimming and annotation.

NADfi	inder-package Call peaks for nucleolar-associated domains (NADs) sequencing data	

Description

Index

Call peaks for two purified nucleoli samples: target and control. It will count the reads for tiles of the genome and NADs, then convert it to ratios. The ratios will be corrected and smoothed. The z-scores is calculated for each counting windows over the background. The peaks will be detected based on z-scores.

backgroundCorrection Correct ratios for background

Description

Background correct ratios of read counts for each window.

Usage

backgroundCorrection(ratios)

Arguments

ratios A vector of numeric. It is the ratios of counts for each window. butterFilter 3

Details

This function implements the backgound correction methods of algorithm for polynomial fitting. See details via baseline.modpolyfit. This function expects the trendency of decreasing of the ratios from 5' end to 3' end.

Value

A vector of numeric. It is the background corrected ratios.

Examples

```
x <- runif(200)
background <- rep(c(20:1)/100, each=10)
backgroundCorrection(x)</pre>
```

butterFilter

Low pass filter on ratios by butterworth filter

Description

The Butterworth filter is a type of signal processing filter designed to have as flat a frequency response as possible in the passband.

Usage

```
butterFilter(ratios, N = ceiling(length(ratios)/200))
```

Arguments

ratios A vector of numeric. It is the ratios of counts in each window.

N numeric(1) or integer(1). Critical frequencies of the low pass filter will be set as

1/N. 1/N is a cutoff at 1/N-th of the Nyquist frequency. Default suppose there

are about 200 peaks in the inputs.

Value

A vector of numeric with same length of input ratios. The vector indicates smoothed ratios.

```
ratios <- runif(20000)
butterFilter(ratios)</pre>
```

4 callPeaks

callPeaks

call peaks for ratios of repeats

Description

Use limma to call peaks for ratios of repeats

Usage

```
callPeaks(se, backgroundCorrectionAssay = "bcRatio",
normlizationMethod = "quantile", N = 100, cutoffAdjPvalue = 0.05,
countFilter = 1000, ...)
```

Arguments

se

An object of RangedSummarizedExperiment with assays of raw counts, ratios, background correct ratios, smoothed ratios and z-scores. It should be an element of output of smoothRatiosByChromosome

backgroundCorrectionAssay

character(1). Assays names for background correction ratios

normlizationMethod

character(1) specifying the normalization method to be used. Choices are "none", "scale", "quantile" or "cyclicloess". See normalizeBetweenArrays for details.

Ν

numeric(1) or integer(1). Critical frequencies of the low pass filter will be set as

1/N. 1/N is a cutoff at 1/N-th of the Nyquist frequency. Default 100.

cutoffAdjPvalue

numeric(1). Cutoff adjust p-value.

countFilter

numeric(1). Cutoff value for mean of raw reads count in each window.

... Parameter not used.

Value

An object of GRanges of peak list with metadata "AveSig", "P.Value", and "adj.P.Val", where "AveSig" means average signals.

countByOverlaps 5

countByOverlaps Count overlapping genomic ranges
--

Description

Count the reads in a given feature. This function does not work for parallel.

Usage

```
countByOverlaps(features, reads, ignore.strand, inter.feature)
```

Arguments

features A object of GRanges represents the feature regions to be counted.

reads object that represents the data to be counted. See summarizeOverlaps.

ignore.strand logical(1). ignore strand?

inter.feature not used. This parameter is required by summarizeOverlaps.

Value

return a vector of counts the same length as features.

cumulativePercentage Plot the cumulative percentage tag allocation in sample

Description

Plot the difference between the cumulative percentage tag allocation in paired samples.

Usage

```
cumulativePercentage(se, binWidth = 1e+05,
backgroundCorrectionAssay = "bcRatio", ...)
```

Arguments

se An object of RangedSummarizedExperiment with assays of raw counts, ratios,

background correct ratios, smoothed ratios and z-scores. It should be an element

of output of smoothRatiosByChromosome.

binWidth numeric(1) or integer(1). The width of each bin.

backgroundCorrectionAssay

character(1). Assays names for background correction ratios.

... Parameter not used.

Value

A list of data.frame with the cumulative percentages.

6 exportSignals

Published online 2012 Mar 31. doi: 10.1515/1544-6115.1750 PMCID: PMC3342857

Examples

exportSignals

output signals to file

Description

Output signals to bedgraph, bed, wig, etc, for track viewer

Usage

```
exportSignals(dat, assayName, colName, con, format = "bedGraph", ...)
```

Arguments

dat	An object of GRanges, or RangedSummarizedExperiment with assays of raw counts, ratios, background correct ratios, smoothed ratios and z-scores. It should be an element of output of smoothRatiosByChromosome
assayName	character(1). Assay name for RangedSummarizedExperiment
colName	character(1). Column name of metadata of dat or assay of dat for coverage weight, see coverage, RangedSummarizedExperiment.
con	The connection to which data is saved. If this is a character vector, it is assumed to be a filename and a corresponding file connection is created and then closed after exporting the object. If missing, a SimpleRleList will be returned.
format	The format of the output. see export.

Value

If con is missing, a SimpleRleList will be returned. Otherwise, nothing is returned.

Parameters to pass to export

getCorrelations 7

Examples

 ${\tt getCorrelations}$

get correlations for replicates

Description

Get the correlations of replicates by the coverage of peaks. The signals will be filter by the background cutoff value and the correlations will be calculated.

Usage

```
getCorrelations(se, chr = paste0("chr", seq_len(21)), ratioAssay = "ratio",
  window = 10000, cutoff = 1, method = c("spearman", "pearson",
  "kendall"), ...)
```

Arguments

se	A RangedSummarizedExperiment object. The output of log2se.
chr	A vector of character. Filter for seqnames. It should be the chromosome names to be kept.
ratioAssay	character(1). Column name of ratio for correlation calculation.
window	numeric(1) or integer(1). The window size for summary of the ratios.
cutoff	numeric(1). All the coverages lower than cutoff value in a given window will be filtered out.
method	A character string indicating which correlation coefficient is to be computed. See cor.
	Parameters not used.

Value

A list of matrixes of correlation and coefficient.

8 log2ratio

Examples

groupZscores

Calculate z-scores for each peak

Description

Detect peaks and calculate z-scores for each peak

Usage

```
groupZscores(zscore)
```

Arguments

zscore

A vector of numeric. It is the z-scores of ratios in each window.

Value

A data.frame with column names as "zscore", "group", "grp.zscore", and "pvalue".

Examples

```
x <- seq_len(500)
a <- 2 * 2*pi/length(x)
y <- 20 * sin(x*a)
noise1 <- 20 * 1/10 * sin(x*a*10)
zscore <- y+noise1
groupZscores(zscore)</pre>
```

log2ratio

calculate the log2 transformed ratios

Description

calculate the log2 transformed ratios for nucleosome vs genome. pseudo-count will be used to avoid x/0.

Usage

```
log2ratio(A, B, pseudocount)
```

log2se 9

Arguments

A, B counts for nucleosome and genome. They should be numeric vectors with iden-

tical length.

pseudo-count will be used to aviod x/0 by x/pseudocount. If it is not set, pseudo-

count will be the minimal count except 0 of inputs.

Value

A vector of numeric of log2 transformed ratios.

Examples

```
log2ratio(seq_len(10), 10:1)
```

log2se

calculate the log2 transformed ratios for SummarizedExperiment class

Description

Calculate the log2 transformed ratios for nucleosome vs genome. pseudo-count will be used to avoid x/0.

Usage

```
log2se(se, nucleosomeCols, genomeCols, pseudocount)
```

Arguments

se A RangedSummarizedExperiment object. The output of tileCount.

 ${\tt nucleosomeCols}, \ {\tt genomeCols}$

column Names of counts for nucleosome and genome. They should be the col-

umn names in the assays of se. Ratios will be calculated as log2(nucleosomeCols/genomeCols).

pseudo-count will be used to aviod x/0 by x/pseudocount. If it is not set, pseudo-

count will be the minimal count except 0 of inputs.

Value

A RangedSummarizedExperiment object with log2 transformed ratios. Assays will be named as nucleosome, genome and ratio.

10 plotSig

peakdet	Detect peak positions	

Description

Detect the peaks positions and valley positions. The algorithm is modified from github::dgromer/peakdet

Usage

```
peakdet(y, delta = 0, silence = TRUE)
```

Arguments

y A vector of numeric where to search peaks

delta A numeric of length 1, defining the local threshold for peak detection. If it is set

to 0, the delta will be set to 1/10 of the range of y.

silence logical(1). If false, echo the delta value when delta is set as 0.

Value

A list with peakpos and valleypos. Both peakpos and valleypos are vectors of numeric which indicate the positions of peak or valley.

Examples

```
y <- runif(200)
peakdet(y)</pre>
```

plotSig

plot signals with ideograms

Description

Plot signals with ideograms for GRangesList.

Usage

```
plotSig(ideo, grList, mcolName, ...)
```

Arguments

ideo Output of loadIdeogram.grList A GRangesList of data to plot.

mcolName Column name of metadata of GRangesList for plotting.

... Parameters to pass to ideogramPlot

Value

Invisible argument list for ideogramPlot.

single.count 11

Examples

single.count

counts data for single experiment of chromosome 18

Description

counts data for single experiment of chromosome 18

smoothRatiosByChromosome

smooth the ratios by chromosome

Description

Split the ratios by chromosome and do background correction and smooth.

Usage

```
smoothRatiosByChromosome(se, chr = paste0("chr", c(seq_len(21), "X", "Y")),
  ratioAssay = "ratio", backgroundCorrectionAssay = "bcRatio",
  smoothedRatioAssay = "smoothedRatio", zscoreAssay = "zscore",
  backgroundPercentage = 0.25, ...)
```

Arguments

se An object of RangedSummarizedExperiment with scores. Output of log2se

chr A vector of character. Filter for segnames. It should be the chromosome names

to be kept.

ratioAssay The name of assay in se, which store the values to be smoothed.

 ${\tt backgroundCorrectionAssay, smoothedRatioAssay, zscoreAssay}$

character(1). Assays names for background correction ratios, smoothed ratios

and z-score based on background correction ratios.

backgroundPercentage

numeric(1). Percentage of values for background, see zscoreOverBck. How

many percent lower values will be treated as background.

... Parameters could be passed to butterFilter.

12 tileCount

Value

A SimpleList of RangedSummarizedExperiment with smoothed ratios.

Examples

```
data(single.count)
se <- single.count
dat <- log2se(se, nucleosomeCols="nucleosome.bam", genomeCols="genome.bam")
dat <- smoothRatiosByChromosome(dat, N=100)</pre>
```

tileCount

Perform overlap queries between reads and genome by windows

Description

tileCount extends summarizeOverlaps by providing fixed window size and step to split whole genome into windows and then do queries. It will return counts in each window.

Usage

```
tileCount(reads, genome, windowSize = 100000L, step = 10000L,
  mode = countByOverlaps, dataOverSamples = FALSE, ...)
```

Arguments

reads A GRanges, GRangesList (should be one read per list element), GAlignments,

GAlignmentsList, GAlignmentPairs or BamFileList object that represents the

data to be counted by summarizeOverlaps.

genome The object from/on which to get/set the sequence information.

windowSize numeric(1) or integer(1). Size of windows. step numeric(1) or integer(1). Step of windows.

mode mode can be one of the pre-defined count methods. see summarizeOverlaps. de-

fault is countByOverlaps, alia of countOverlaps(features, reads, ignore.strand=ignore.strand)

dataOverSamples

logical(1). Data over several samples when use GRangesList as input?

... Additional arguments passed to summarizeOverlaps.

Value

A RangedSummarizedExperiment object. The assays slot holds the counts, rowRanges holds the annotation from sliding widows of genome.

trimPeaks 13

Examples

```
## Not run:
fls <- list.files(system.file("extdata", package="GenomicAlignments"),
recursive=TRUE, pattern="*bam$", full=TRUE)
names(fls) <- basename(fls)
genes <- GRanges(seqlengths = c(chr2L=7000, chr2R=10000))
se <- tileCount(fls, genes, windowSize=1000, step=500)

## End(Not run)

##
genome <- GRanges("chr1", IRanges(1, 1))
seqlengths(genome) <- c(chr1=1000)
reads <- GRanges("chr1", IRanges((seq_len(90))*10, width=10))
tileCount(reads, genome, windowSize=100, step=50)</pre>
```

trimPeaks

Trim peaks

Description

Filter the peaks by pvalue and trim the range of peaks for sample without duplicates.

Usage

```
trimPeaks(se, cutoffPvalue = 0.05, backgroundPercentage = 0.25,
  countFilter = 1000, ratioAssay = "ratio",
  backgroundCorrectionAssay = "bcRatio",
  smoothedRatioAssay = "smoothedRatio", zscoreAssay = "zscore")
```

Arguments

se

An object of RangedSummarizedExperiment with assays of raw counts, ratios, background correct ratios, smoothed ratios and z-scores. It should be an element of output of smoothRatiosByChromosome

cutoffPvalue numeric(1). Cutoff p-value.

backgroundPercentage

numeric(1). Cutoff value for the peaks height.

countFilter

 $numeric (1) \ or \ integer (1). \ Cutoff \ value \ for \ mean \ of \ raw \ reads \ count \ in \ each$

window.

ratioAssay

character(1). The name of assay in se, which store the values to be smoothed.

 ${\tt backgroundCorrectionAssay, smoothedRatioAssay, zscoreAssay}$

Assays names for background correction ratios, smoothed ratios and z-score based on background correction ratios.

Value

An object of GRanges.

14 zscoreOverBck

Examples

triplicates.counts

counts data for triplicates of chromosome 18

Description

counts data for triplicates of chromosome 18

zscoreOverBck

Z-scores over the background

Description

Calculate the z-scores over the lower percentage values.

Usage

```
zscoreOverBck(ratios, backgroundPercentage = 0.25)
```

Arguments

```
ratios A vector of numeric. It is the ratios of counts in each window. backgroundPercentage numeric(1). Percentage of value for background.
```

Value

A vector of numeric. Z-scores.

```
r <- runif(200)
zscoreOverBck(r)</pre>
```
